### 12.0.0 GAS LAWS (15 LESSONS)

## (a)Gas laws

1. Matter is made up of small particle in accordance to Kinetic Theory of matter: Naturally, there are basically three states of matter: Solid, Liquid and gas: (i)A solid is made up of particles which are very closely packed with a definite/fixed shape and fixed/definite volume /occupies definite space. It has a very high density.
(ii) A liquid is made up of particles which have some degree of freedom. It thus has no definite/fixed shape. It takes the shape of the container it is put. A liquid has fixed/definite volume/occupies definite space.
(iii)A gas is made up of particles free from each other. It thus has no definite /fixed shape. It takes the shape of the container it is put. It has no fixed/definite volume/occupies every space in a container.
2.Gases are affected by physical conditions. There are two physical conditions:
(i)Temperature
(ii)Pressure
2. The SI unit of temperature is $\operatorname{Kelvin}(\mathbf{K})$.

Degrees Celsius/Centigrade $\left({ }^{0} \mathrm{C}\right)$ are also used.
The two units can be interconverted from the relationship:

$$
{ }^{0} \mathrm{C}+273=\mathrm{K}
$$

## Practice examples

1. Convert the following into Kelvin.
(i) $\mathrm{O}^{\mathbf{0}} \mathrm{C}$
${ }^{\circ} \mathrm{C}+273=\mathrm{K}$ substituting: $\mathrm{O}^{\circ} \mathrm{C}+273=273 \mathrm{~K}$
(ii) $-273{ }^{\mathbf{0}} \mathbf{C}$
${ }^{\mathbf{0}} \mathrm{C}+\mathbf{2 7 3}=\mathrm{K}$ substituting : $-273^{\circ} \mathrm{C}+273=\mathbf{0} \mathrm{K}$
(iii) $25^{\circ} \mathrm{C}$
${ }^{\mathbf{0}} \mathrm{C}+\mathbf{2 7 3}=\mathrm{K}$ substituting : $25^{\circ} \mathrm{C}+273=298 \mathrm{~K}$
(iv) $100{ }^{\mathbf{0}} \mathrm{C}$
${ }^{\mathbf{0}} \mathbf{C}+\mathbf{2 7 3}=\mathbf{K}$ substituting $: 100{ }^{\circ} \mathrm{C}+273=373 \mathrm{~K}$
2. Convert the following into degrees Celsius/Centigrade $\left({ }^{\circ} \mathrm{C}\right)$.
(i) 10 K

$$
\text { K -273 }={ }^{\circ} \mathrm{C} \text { substituting: } 10-273=-263^{\circ} \mathrm{C} \text { (ii) }
$$

(i) 1 K

$$
\mathrm{K}-273={ }^{\circ} \mathrm{C} \text { substituting: } 1-273=-272{ }^{\circ} \mathrm{C}
$$

(iii) 110 K

$$
\mathrm{K}-273={ }^{\circ} \mathrm{C} \text { substituting: } \quad 110-273=-163{ }^{\circ} \mathrm{C}
$$

(iv) -24 K

$$
\mathrm{K}-273={ }^{\circ} \mathrm{C} \text { substituting: } \quad-24-273=-297^{\circ} \mathrm{C}
$$

The standard temperature is $273 \mathrm{~K}=0^{\circ} \mathrm{C}$.
The room temperature is assumed to be $298 \mathrm{~K}=25^{\circ} \mathrm{C}$
4. The SI unit of pressure is $\operatorname{Pascal}(\mathbf{P a}) /$ Newton per metre squared $\left(\mathrm{Nm}^{-2}\right)$ . Millimeters' of mercury $(\mathbf{m m H g})$,centimeters of mercury $(\mathbf{c m H g})$ and atmospheres are also commonly used.

The units are not interconvertible but Pascals $(\mathrm{Pa})$ are equal to Newton per metre squared $\left(\mathrm{Nm}^{-2}\right)$.
The standard pressure is the atmospheric pressure.
Atmospheric pressure is equal to about:
(i) 101325 Pa
(ii) $101325 \mathrm{Nm}^{-2}$
(iii) 760 mmHg
(iv) 76 cmHg
5. Molecules of gases are always in continuous random motion at high speed.

This motion is affected by the physical conditions of temperature and pressure. Physical conditions change the volume occupied by gases in a closed system. The effect of physical conditions of temperature and pressure was investigated and expressed in both Boyles and Charles laws.
6. Boyles law states that
"the volume of a fixed mass of a gas is inversely proportional to the pressure at constant/fixed temperature"
Mathematically:

From Boyles law, an increase in pressure of a gas cause a decrease in volume. i.e doubling the pressure cause the volume to be halved.
Graphically therefore a plot of volume $(\mathbf{V})$ against pressure $(\mathbf{P})$ produces a curve.

P
Graphically a plot of volume( $\mathbf{V}$ ) against inverse/reciprocal of pressure
(1/p) produces a straight line

For two gases then $\mathbf{P}_{\mathbf{1}} \mathbf{V}_{\mathbf{1}}=\mathbf{P}_{\mathbf{2}} \mathbf{V}_{\mathbf{2}}$
$\mathrm{P}_{1}=$ Pressure of gas 1
$\mathrm{V}_{1}=$ Volume of gas 1
$\mathrm{P}_{2}=$ Pressure of gas 2
$\mathrm{V}_{2}=$ Volume of gas 2

Practice examples:

1. A fixed mass of gas at 102300 Pa pressure has a volume of 25 cm 3 . Calculate its volume if the pressure is doubled.
Working
$\mathrm{P}_{1} \mathrm{~V}_{1}=\quad \mathrm{P}_{2} \mathrm{~V}_{2}$ Substituting :102300×25=(102300×2)$\times \mathrm{V}_{2} \mathrm{~V}_{2}$ $=\underline{102300 \times 25}=12.5 \mathrm{~cm} 3$
(102300 x 2)
2. Calculate the pressure which must be applied to a fixed mass of $100 \mathrm{~cm}^{3}$ of Oxygen for its volume to triple at $100000 \mathrm{Nm}^{-2}$.

$$
\begin{gathered}
\mathrm{P}_{1} \mathrm{~V}_{1}=\mathrm{P}_{2} \mathrm{~V}_{2} \quad \begin{array}{c}
\text { Substituting : } 100000 \times \quad 100=\mathrm{P}_{2} \times(100 \times 3) \\
\mathrm{V}_{2}=\frac{100000 \times 100}{(100 \times 3)}=33333.3333 \mathrm{Nm}^{-2}
\end{array}
\end{gathered}
$$

3.A $60 \mathrm{~cm}^{3}$ weather ballon full of Hydrogen at atmospheric pressure of 101325 Pa was released into the atmosphere. Will the ballon reach stratosphere where the pressure is 90000 Pa ?

$$
\begin{gathered}
\mathrm{P}_{1} \mathrm{~V}_{1}=\mathrm{P}_{2} \mathrm{~V}_{2} \text { Substituting : } 101325 \times 60=90000 \times \mathrm{V}_{2} \\
\mathrm{~V}_{2}=\frac{101325}{90000} \underline{60}=67.55 \mathrm{~cm} 3
\end{gathered}
$$

The new volume at $67.55 \mathrm{~cm}^{3}$ exceed ballon capacity of 60.00 $\mathrm{cm}^{3}$. It will burst before reaching destination.
7. Charles law states that"the volume of a fixed mass of a gas is directly proportional to the absolute temperature at constant/fixed pressure " Mathematically:
Volume
$\boldsymbol{\alpha}$
Pressure (Fixed/constant pressure)
V $\quad \boldsymbol{\alpha} \quad \mathrm{T} \quad$ (Fixed/constant $\mathbf{P})$ ieV $=\frac{\text { Constant }}{\mathrm{T}}(\mathrm{k})$

From Charles law , an increase in temperature of a gas cause an increase in volume. i.e doubling the temperature cause the volume to be doubled.

Gases expand/increase by $1 / 273$ by volume on heating. Gases contact/decrease by $1 / 273$ by volume on cooling at constant/fixed pressure.
The
volume of a gas continue decreasing with decrease in temperature until at $\mathbf{- 2 7 3} \mathbf{~} \mathbf{C} / \mathbf{0} \mathrm{K}$ the volume is zero. i.e. there is no gas.
This temperature is called absolute zero. It is the lowest temperature at which a gas can exist.

Graphically therefore a plot of volume (V) against Temperature( $\mathbf{T}$ ) in:
()$^{\circ}{ }^{\circ} \mathrm{C}$ produces a straight line that is extrapolated to the absolute zero of $-273^{\circ} \mathrm{C}$.

(ii)Kelvin/K produces a straight line from absolute zero of $\mathbf{O}$ Kelvin

For two gases then $\quad \frac{\mathrm{V}_{1}}{\mathrm{I}_{1}} \quad \frac{\mathrm{~V}_{2}}{\mathbf{I}_{2}}$

$$
\begin{aligned}
& \mathrm{T}_{1}=\text { Temperature in Kelvin of gas } 1 \\
& \mathrm{~V}_{1}=\text { Volume of gas } 1 \\
& \mathrm{~T}_{2}=\text { Temperature } \underline{\text { in Kelvin }} \text { of gas } 2 \\
& \mathrm{~V}_{2}=\text { Volume of gas } 2
\end{aligned}
$$

Practice examples:
$1.500 \mathrm{~cm}^{3}$ of carbon(IV)oxide at $0^{\circ} \mathrm{C}$ was transfered into a cylinder at $-4^{\circ} \mathrm{C}$. If the capacity of the cylinder is $450 \mathrm{~cm}^{3}$,explain what happened.

$$
\begin{array}{ll}
\frac{\mathrm{V}}{\mathrm{~T}_{1}^{-}}{ }^{=} \frac{\mathrm{V}_{2}}{\mathrm{~T}_{2}^{-}} \text {substituting } & \frac{500}{(0+273)}=\underset{(-4+273)}{ } \\
& =\frac{\mathrm{V}_{2}}{(0+273)}
\end{array}
$$

The capacity of cylinder $\left(500 \mathrm{~cm}^{3}\right)$ is less than new volume $\left(492.674 \mathrm{~cm}^{3}\right)$.
$7.326 \mathrm{~cm}^{3}\left(500-492.674 \mathrm{~cm}^{3}\right)$ of carbon(IV) oxide gas did not fit into the cylinder.
2. A mechanic was filling a deflated tyre with air in his closed garage using a hand pump. The capacity of the tyre was $40,000 \mathrm{~cm}^{3}$ at room temperature. He rolled the tyre into the car outside. The temperature outside was
$30^{\circ} \mathrm{C}$. Explain what happens.

$$
\begin{aligned}
\frac{\mathrm{V}}{\mathrm{~T}_{1}^{-}}{ }_{1}^{=} \frac{\mathrm{V}_{2}}{\mathrm{~T}_{2}^{-}} \text {substituting } & \frac{40000}{(\mathbf{2 5 + 2 7 3 )}}=\stackrel{\mathrm{V}_{2}}{(\mathbf{3 0}+273)} \\
& =\frac{40000 \times(30 \times 273)}{(25+273)}=40671.1409 \mathrm{cm3}
\end{aligned}
$$

The capacity of a tyre $(40000 \mathrm{~cm} 3)$ is less than new volume $(40671.1409 \mathrm{~cm} 3)$. The tyre thus bursts.
3. A hydrogen gas balloon with 80 cm 3 was released from a research station at room temperature. If the temperature of the highest point it rose is $-30^{\circ} \mathrm{C}$, explain what happened.

$$
\begin{aligned}
\frac{\mathrm{V}}{\mathrm{~T}_{1}^{-}} 1=\frac{\mathrm{V}_{2}}{\mathrm{~T}_{2}^{-}} \text {substituting } \quad \frac{80}{(\mathbf{2 5}+273)} \quad=\quad \underline{\mathrm{V}}_{2} & \\
& =\underline{(-30 \times(-30 \times 273)} \\
& =\mathbf{6 5 . 2 3 4 9} \mathbf{c m 3}
\end{aligned}
$$

The capacity of balloon $(80 \mathrm{~cm} 3)$ is more than new volume $(65.2349 \mathrm{~cm} 3)$. The balloon thus remained intact.
8. The continuous random motion of gases differ from gas to the other.The movement of molecules (of a gas) from region of high concentration to a region of low concentration is called diffusion.
The rate of diffusion of a gas depends on its density. i.e. The higher the rate of diffusion, the less dense the gas.
The density of a gas depends on its molar mass/relative molecular mass. i.e. The higher the density the higher the molar mass/relative atomic mass and thus the lower the rate of diffusion.

## Examples

1.Carbon (IV)oxide $\left(\mathrm{CO}_{2}\right)$ has a molar mass of 44 g .Nitrogen $\left(\mathrm{N}_{2}\right)$ has a molar mass of 28g. ( $\mathrm{N}_{2}$ )is thus lighter/less dense than Carbon (IV)oxide $\left(\mathrm{CO}_{2}\right) . \mathrm{N}_{2}$ diffuses faster than $\mathrm{CO}_{2}$.
2.Ammonia $\left(\mathrm{NH}_{3}\right)$ has a molar mass of 17 g .Nitrogen $\left(\mathrm{N}_{2}\right)$ has a molar mass of 28 g . $\left(\mathrm{N}_{2}\right)$ is thus about twice lighter/less dense than Ammonia $\left(\mathrm{NH}_{3}\right)$.
Ammonia $\left(\mathrm{NH}_{3}\right)$ diffuses twice faster than $\mathrm{N}_{2}$.
3. Ammonia $\left(\mathrm{NH}_{3}\right)$ has a molar mass of 17 g .Hydrogen chloride gas has a molar mass of 36.5 g . Both gases on contact react to form white fumes of ammonium chloride. When a glass/cotton wool dipped in ammonia and another glass/cotton wool dipped in hydrochloric acid are placed at opposite ends of a glass tube, both gases diffuse towards each other. A white disk appears near to glass/cotton wool dipped in hydrochloric acid. This is because hydrogen chloride is heavier/denser than Ammonia and thus its rate of diffusion is lower .

Diffusion of ammonia and hydrogen chloride

Chemical equation: $\mathrm{HCl}(\mathrm{g})+\mathrm{NH}_{3}(\mathrm{~s}) \rightarrow \mathrm{NH}_{3} \mathrm{Cl}(\mathrm{s})$

The rate of diffusion of a gas is in accordance to Grahams law of diffusion.
Grahams law states that:
"the rate of diffusion of a gas is inversely proportional to the square root of its density, at the same/constant/fixed temperature and pressure"
Mathematically
$\mathbf{R} \boldsymbol{\alpha} \underline{1}$ and since density is proportional to mass then $\mathbf{R} \boldsymbol{\alpha} \underline{1}$
For two gases then:

where: R and $\mathrm{R}_{2}$ is the rate of diffusion of $1^{\text {st }}$ and $2^{\text {nd }}$ gas.
M 1 and $\mathrm{M}_{2}$ is the $\xrightarrow{\text { molar mass }}$ of $1^{\text {st }}$ and $2^{\text {nd }}$ gas.
Since rate is inverse of time. i.e. the higher the rate the less the time:
For two gases then:
$\underline{T}=\underline{T}$ where: T and $\mathrm{T}_{2}$ is the time taken for $1^{\text {st }}$ and $2^{\text {nd }}$ gas to diffuse.
$\overline{\sqrt{M}}_{1} \quad \sqrt{\mathrm{M}_{2}}$
M 1 and $\mathrm{M}_{2}$ is the molar mass of $1^{\text {st }}$ and $2^{\text {nd }}$ gas.
Practice examples:

1. It takes 30 seconds for 100 cm 3 of carbon(IV)oxide to diffuse across a porous plate. How long will it take 150 cm 3 of nitrogen(IV)oxide to diffuse across the same plate under the same conditions of temperature and pressure. $(\mathrm{C}=12.0, \mathrm{~N}=14.0=16.0)$

$$
\text { Molar mass } \mathrm{CO}_{2}=44.0 \quad \text { Molar mass } \mathrm{NO}_{2}=46.0
$$

Method 1

$$
\begin{aligned}
& 100 \mathrm{~cm} 3 \mathrm{CO}_{2} \text { takes 30seconds } \\
& 150 \mathrm{~cm} 3 \text { takes } \frac{150 \times 30}{100}=\underline{45 \text { seconds }} \\
& \frac{\mathrm{T} \mathrm{CO}_{2}}{\mathrm{~T} \mathrm{NO}_{2}^{-}} \quad=\frac{\sqrt{\text { molar mass }}}{\sqrt{\text { molar mass }} \mathrm{NO}_{2}}=\underset{\mathrm{NO}_{2}}{\mathrm{~T} \mathrm{NO}_{2}}=\sqrt{\sqrt{46 \text { seconds }}}=\sqrt{44.0} \\
& \mathrm{TNO}_{2}=\underline{\text { 45seconds } \mathrm{x} \sqrt{ } 46.0} \quad=\underline{46.0114} \text { seconds }
\end{aligned}
$$

Method 2

$$
\begin{aligned}
& 100 \mathrm{~cm} 3 \mathrm{CO}_{2} \text { takes 30seconds } \\
& 1 \mathrm{~cm} 3 \text { takes } \frac{100 \mathrm{x} 1}{30}=\underline{\mathbf{3 . 3 3 3 3} \mathbf{c m} 3 \mathrm{sec}^{-1}} \\
& \frac{\mathrm{R} \mathrm{CO}_{2}}{\mathrm{R} \mathrm{NO}_{2}}=\sqrt{\sqrt{ } \text { molar mass } \mathrm{NO}_{2}}=>\frac{3.3333{\mathrm{~cm} 3 \mathrm{sec}^{-1}}_{\text {molar mass }}^{\mathrm{RO}_{2}}}{\mathrm{R} \mathrm{NO}_{2}}=\sqrt{46.0} \\
& \mathrm{RNO}_{2}=\frac{3.3333 \mathrm{~cm} 3 \mathrm{sec}^{-1} \mathbf{x} \sqrt{ } 44.0}{\sqrt{46.0}} \quad=\underline{\mathbf{3 . 2 6 0 1}{\mathrm{cm} 3 \mathrm{sec}^{-1}}} \\
& 3.2601 \mathrm{~cm} 3 \text { takes 1seconds } \\
& 150 \mathrm{~cm} 3 \quad \text { take } \frac{150 \mathrm{~cm} 3}{3.2601 \mathrm{~cm} 3}=\underline{46.0109 \text { seconds }}
\end{aligned}
$$

2. How long would 200 cm 3 of Hydrogen chloride take to diffuse through a porous plug if carbon(IV)oxide takes 200seconds to diffuse through.

Molar mass $\mathrm{CO}_{2}=44 \mathrm{~g} \quad$ Molar mass $\mathrm{HCl}=36.5 \mathrm{~g}$

$$
\mathrm{T} \mathrm{HCl}=\frac{\mathbf{2 0 0} \text { seconds } \mathbf{x} \sqrt{ } \mathbf{3 6 . 5}}{\sqrt{44.0}} \quad=\underline{\mathbf{1 8 2 . 1 5 8 8}} \text { seconds }
$$

3. Oxygen gas takes 250 seconds to diffuse through a porous diaphragm. Calculate the molar mass of gas $\mathbf{Z}$ which takes 227 second to diffuse.

Molar mass $\mathrm{O}_{2}=32 \mathrm{~g} \quad$ Molar mass $\mathrm{Z}=\mathrm{x} \mathrm{g}$ $\frac{\mathrm{T} \mathrm{O}_{2}}{\mathrm{~T} \mathrm{Z}}=\sqrt{ } \frac{\text { molar mass }}{\sqrt{\text { molar mass }}} \mathrm{O}_{2} \mathrm{Z} \quad \Rightarrow \frac{250 \text { seconds }}{227 \text { seconds }}=\sqrt{\sqrt{ }} \underline{32.0}$

$$
V_{\mathbf{x}}=\frac{227 \text { seconds } \mathbf{x} \sqrt{ } \mathbf{3 2}}{250} \quad \underline{26.3828} \mathrm{grams}
$$

4.25 cm 3 of carbon(II)oxide diffuses across a porous plate in 25 seconds. How long will it take 75 cm 3 of Carbon(IV)oxide to diffuse across the same plate under the same conditions of temperature and pressure. ( $C=12.0,0=16.0$ )

Molar mass $\mathrm{CO}_{2}=44.0 \quad$ Molar mass $\mathrm{CO}=28.0$
Method 1
25 cm 3 CO takes 25 seconds
$75 \mathrm{~cm} 3 \quad$ takes $\frac{75 \times 25}{25}=\underline{75 \text { seconds }}$

$$
\begin{aligned}
& \frac{\mathrm{T} \mathrm{CO}_{2}}{\mathrm{~T} \mathrm{CO}}=\sqrt{\sqrt{\text { molar mass }}} \mathrm{CO}_{2}=\underset{\frac{\mathrm{T} \mathrm{CO}_{2}}{\text { molar mass }} \mathrm{CO}}{\mathrm{T5}}=\underset{\sqrt{28.0}}{\sqrt{44.0}} \\
& \mathrm{TCO}_{2}=\underline{75 \text { seconds } \mathbf{x} \sqrt{ } 44.0} \quad=\underline{\mathbf{9 4 . 0 1 7 5}} \text { seconds }
\end{aligned}
$$

Method 2
$25 \mathrm{~cm} 3 \mathrm{CO}_{2}$ takes 25 seconds
1 cm 3 takes $\frac{25 \times 1}{25}=\underline{1.0 \mathrm{~cm} 3 \mathrm{sec}^{-1}}$
$\frac{\mathrm{R} \mathrm{CO}_{2}}{\mathrm{R} \mathrm{CO}^{-}}=\sqrt{\sqrt{ }} \frac{\text { molar mass }}{\text { molar mass }} \mathrm{CO}_{2} \quad \frac{\mathrm{x} \mathrm{cm3} \mathrm{\sec }^{-1}}{1.0 \mathrm{cm3sec}^{-1}}=\sqrt{\sqrt{ } \underline{28.0}}$
$\mathrm{RCO}_{2}=\frac{1.0 \mathrm{~cm} 3 \mathrm{sec}^{-1} \mathbf{x} \sqrt{ } 28.0}{\sqrt{44.0}}=\underline{\mathbf{0 . 7 9 7 7}} \mathrm{cm} 3 \mathrm{sec}^{-1}$
$\begin{array}{lll}0.7977 \mathrm{~cm} 3 \\ 75 \mathrm{~cm} 3\end{array} \quad \begin{aligned} & \text { takes } \\ & \text { takes }\end{aligned} \begin{gathered}1 \text { seconds } \\ 3\end{gathered} \quad=\mathbf{9 4 . 0 2 0 3 \text { seconds }}$

### 13.0.0 THE MOLE-FORMULAE AND <br> CHEMICAL EQUATIONS (40 LESSONS)

## Introduction to the mole, molar masses and Relative atomic masses

1. The mole is the SI unit of the amount of substance.
2. The number of particles e.g. atoms, ions, molecules, electrons, cows, cars are all measured in terms of moles.
3. The number of particles in one mole is called the Avogadros Constant. It is denoted "L".
The Avogadros Constant contain $\mathbf{6 . 0 2 3 \times 1 0} \mathbf{2 3}$ particles. i.e.

$$
\begin{array}{ll}
1 \text { mole }=6.023 \times 10^{23} \text { particles } & =6.023 \times 10^{23} \\
2 \text { moles }=2 \times 6.023 \times 10^{23} \text { particles } & =1.205 \times 10^{24} \\
0.2 \text { moles }=0.2 \times 6.023 \times 1023 \text { particles } & =1.205 \times 10^{22} \\
0.0065 \text { moles }=0.0065 \times 6.023 \times 10^{23} \text { particles } & =3.914 \times 10^{21}
\end{array}
$$

3. The mass of one mole of a substance is called molar mass. The molar mass of: (i)an element has mass equal to relative atomic mass /RAM(in grams)of the element e.g.

Molar mass of carbon(C)= relative atomic mass $=12.0 \mathrm{~g}$
$6.023 \times 10^{23}$ particles of carbon $=1$ mole $=12.0 \mathrm{~g}$
Molar mass of sodium $(\mathrm{Na})=$ relative atomic mass $=23.0 \mathrm{~g}$
$6.023 \times 10^{23}$ particles of sodium $=1$ mole $=23.0 \mathrm{~g}$
Molar mass of $\operatorname{Iron}(\mathrm{Fe})=$ relative atomic mass $=56.0 \mathrm{~g}$
$6.023 \times 10^{23}$ particles of iron $=1$ mole $=56.0 \mathrm{~g}$
(ii) a molecule has mass equal to relative molecular mass /RMM (in grams)of the molecule. Relative molecular mass is the sum of the relative atomic masses of the elements making the molecule.
The number of atoms making a molecule is called atomicity. Most gaseous molecules are diatomic (e.g. $\mathbf{O}_{2}, \mathbf{H}_{2}, \mathbf{N}_{2}, \mathbf{F}_{2}, \mathbf{C l}_{2}, \mathbf{B r}_{2}, \mathbf{I}_{2}$ )noble gases are monoatomic(e.g. $\mathrm{He}, \mathrm{Ar}, \mathrm{Ne}, \mathrm{Xe})$,Ozone gas $\left(\mathrm{O}_{3}\right)$ is triatomic e.g.

Molar mass Oxygen molecule( $\mathbf{O}_{2}$ ) $=$ relative molecular mass $=(16.0 \mathrm{x} 2) \mathrm{g}$ $=32.0 \mathrm{~g} 6.023 \times 10^{23}$ particles of Oxygen molecule $=1$ mole $=32.0 \mathrm{~g}$

Molar mass chlorine molecule $\left(\mathbf{C l}_{2}\right)=$ relative molecular mass $=(35.5 \times 2) \mathrm{g}$ $=71.0 \mathrm{~g} 6.023 \times 10^{23}$ particles of chlorine molecule $=1 \mathrm{~mole}=71.0 \mathrm{~g}$

Molar mass Nitrogen molecule( $\mathbf{N}_{2}$ ) $=$ relative molecular mass $=(14.0 \mathrm{x} 2) \mathrm{g}$ $=28.0 \mathrm{~g} 6.023 \times 10{ }^{23}$ particles of Nitrogen molecule $=1$ mole $=28.0 \mathrm{~g}$
(ii)a compound has mass equal to relative formular mass /RFM (in grams)of the molecule. Relative formular mass is the sum of the relative atomic masses of the elements making the compound. e.g.
(i)Molar mass $\mathbf{W a t e r}\left(\mathbf{H}_{\mathbf{2}} \mathbf{O}\right)=$ relative formular mass $=[(1.0 \times 2)+16.0] \mathrm{g}=18.0 \mathrm{~g}$
$6.023 \times 10^{23}$ particles of Water molecule $=1$ mole $=18.0 \mathrm{~g}$
$6.023 \times 10^{23}$ particles of Water molecule has:

- $\mathbf{2} \times 6.023 \times 10{ }^{23}$ particles of Hydrogen atoms
$-1 \times 6.023 \times 10^{23}$ particles of Oxygen atoms
(ii)Molar mass sulphuric( $\mathbf{V I}) \mathbf{a c i d}\left(\mathbf{H}_{2} \mathbf{S O}_{4}\right)=$ relative formular

$$
\text { mass }=[(1.0 \times 2)+32.0+(16.0 \times 4)] \mathrm{g}=98.0 \mathrm{~g}
$$

$6.023 \times 10{ }^{23}$ particles of sulphuric $(\mathrm{VI}) \operatorname{acid}\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right)=1$ mole $=98.0 \mathrm{~g}$
$6.023 \times 10{ }^{23}$ particles of sulphuric(VI)acid $\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right)$ has:
$-\mathbf{2} \times 6.023 \times 10^{23}$ particles of Hydrogen atoms -
$1 \times 6.023 \times 10^{23}$ particles of Sulphur atoms $-4 \times$
$6.023 \times 10^{23}$ particles of Oxygen atoms
(iii)Molar mass sodium carbonate $(\mathbf{I V})\left(\mathbf{N a}_{2} \mathbf{C O}_{3}\right)=$ relative formular mass $=[(23.0 \times 2)+12.0+(16.0 \times 3)] \mathrm{g}=106.0 \mathrm{~g}$
$6.023 \times 100^{23}$ particles of sodium carbonate(IV) $\left(\mathrm{Na}_{2} \mathrm{CO}_{3}\right)=1$ mole $=106.0 \mathrm{~g}$
$6.023 \times 10{ }^{23}$ particles of sodium carbonate(IV) $\left(\mathrm{Na}_{2} \mathrm{CO}_{3}\right)$ has:
$-2 \times 6.023 \times 10{ }^{23}$ particles of Sodium atoms
$-\mathbf{1} \times 6.023 \times 10{ }^{23}$ particles of Carbon atoms
$-\mathbf{3} \times 6.023 \times 10^{23}$ particles of Oxygen atoms
(iv)Molar mass Calcium carbonate $(\mathbf{I V})\left(\mathbf{C a C O}_{3}\right)=$ relative formular mass $=[(40.0+12.0+(16.0 \times 3)] \mathrm{g}=100.0 \mathrm{~g}$.
$6.023 \times 10^{23}$ particles of Calcium carbonate $(\mathrm{IV})\left(\mathrm{CaCO}_{3}\right)=1$ mole $=100.0 \mathrm{~g}$
$6.023 \times 10^{23}$ particles of Calcium carbonate(IV) $\left(\mathrm{CaCO}_{3}\right)$ has:

- $\mathbf{1} \times 6.023 \times 10{ }^{23}$ particles of Calcium atoms
$-1 \times 6.023 \times 10{ }_{23}^{23}$ particles of Carbon atoms
-3 $\times 6.023 \times 10{ }^{23}$ particles of Oxygen atoms
(v)Molar mass $\mathbf{W a t e r}\left(\mathbf{H}_{2} \mathrm{O}\right)=$ relative formular

$$
\text { mass }=[(2 \times 1.0)+16.0] \mathrm{g}=18.0 \mathrm{~g}
$$

$6.023 \times 10{ }^{23}$ particles of $\operatorname{Water}\left(\mathrm{H}_{2} \mathrm{O}\right)=1$ mole $=18.0 \mathrm{~g}$
$6.023 \times 10{ }^{23}$ particles of Water $\left(\mathrm{H}_{2} \mathrm{O}\right)$ has:

- $2 \times 6.023 \times 10{ }_{23}^{23}$ particles of Hydrogen atoms
$\mathbf{- 2} \times 6.023 \times 10^{23}$ particles of Oxygen atoms

## Practice

1. Calculate the number of moles present
in: (i) 0.23 g of Sodium atoms

$$
\text { Molar mass of Sodium atoms }=23 \mathrm{~g}
$$

$$
\text { Moles }=\frac{\text { mass in grams }}{\text { Molar mass }} \quad=>\frac{0.23 \mathrm{~g}}{23}=\mathbf{0 . 0 1 m o l e s}
$$

(ii) 0.23 g of Chlorine atoms

$$
\begin{aligned}
& \text { Molar mass of Chlorine atoms }=35.5 \mathrm{~g} \\
& \text { Moles =mass in grams } \\
& \\
& \text { Molar mass }
\end{aligned}=>\frac{0.23 \mathrm{~g}}{35.5}=\mathbf{0 . 0 0 6 5 m o l e s} / \mathbf{6 . 5} \times 10^{-\mathbf{5}} \mathbf{~ m o l e s}
$$

(iii) 0.23 g of Chlorine molecules

Molar mass of Chlorine molecules $=(35.5 \times 2)=71.0 \mathrm{~g}$
Moles =mass in grams
Molar mass
$=>\frac{0.23 \mathrm{~g}}{71}=\mathbf{0 . 0 0 3 2} \mathrm{moles} / \mathbf{3 . 2} \times 10^{-3}$ moles
(iv) 0.23 g of dilute sulphuric(VI)acid

Molar mass of $\mathrm{H}_{2} \mathrm{SO}_{4}=[(2 \times 1)+32+(4 \times 14)]=\mathbf{9 8 . 0 g}$
Moles $=\frac{\text { mass in grams }}{\text { Molar mass }}=>\frac{0.23 \mathrm{~g}}{98}=\mathbf{0 . 0 0 2 3 m o l e s ~} / \mathbf{2 . 3} \times 10^{-9}$ moles
2. Calculate the number of atoms present in:(Avogadros constant $\mathrm{L}=6.0 \times 10^{23}$ )
(i) 0.23 g of dilute sulphuric (VI)acid

## Method I

Molar mass of $\mathrm{H}_{2} \mathrm{SO}_{4}=[(2 \times 1)+32+(4 \times 14)]=\mathbf{9 8 . 0 g}$

Moles $=\frac{\text { mass in grams }}{\text { Molar mass }}=>\frac{0.23 \mathrm{~g}}{98}=\mathbf{0 . 0 0 2 3}$ moles $/ \mathbf{2} . \mathbf{3} \times \mathbf{1 0}^{-\mathbf{3}}$ moles
1 mole has $6.0 \times 10^{23}$ atoms
$2.3 \times 10^{-5}$ moles has $\frac{\left(2.3 \times 10^{-5} \times 6.0 \times 10^{25}\right)}{1}=\mathbf{1 . 3 8} \times 10^{\mathbf{2 1}}$ atoms
Method II
Molar mass of $\mathrm{H}_{2} \mathrm{SO}_{4}=[(2 \times 1)+32+(4 \times 14)]=\mathbf{9 8 . 0 g}$
$98.0 \mathrm{~g}=1$ mole has $6.0 \times 10{ }^{23}$ atoms
0.23 g therefore has $\frac{\left(0.23 \mathrm{~g} \mathrm{x} \mathrm{6.0} \mathrm{\times 10}^{23}\right)}{98}=\mathbf{1 . 3 8 \times 1 0}{ }^{\mathbf{2 1}}$ atoms
(ii) 0.23 g of sodium carbonate(IV)decahydrate

Molar mass of $\mathrm{Na}_{2} \mathrm{CO}_{3} .10 \mathrm{H}_{2} \mathrm{O}=$ $[(2 \times 23)+12+(3 \times 16)+(10 \times 1.0)+(10 \times 16)]=\mathbf{2 7 6 . 0} \mathrm{g}$

## Method I

$$
\begin{aligned}
& \text { Moles }=\frac{\text { mass in grams }}{\text { Molar mass }}=>\frac{0.23 \mathrm{~g}}{276}=\begin{array}{l}
\mathbf{0 . 0 0 0 8 3} \text { moles } / \\
\mathbf{8 . 3 \times 1 0 ^ { - 4 }} \text { moles }
\end{array}
\end{aligned}
$$

1 mole has $6.0 \times 10^{23}$ atoms
$8.3 \times 10^{-4}$ moles has $\quad \frac{\left(8.3 \times 10^{-4} \text { moles } \times 6.0 \times 10^{24}\right)}{1}=\mathbf{4 . 9 8 \times 1 0}{ }^{\mathbf{2 0}}$ atoms

## Method II

$276.0 \mathrm{~g}=1$ mole has $6.0 \times 10^{23}$ atoms
0.23 g therefore has $\frac{\left(0.23 \mathrm{~g} \mathrm{x} \mathrm{6.0} \mathrm{\times 10}^{25}\right)}{276.0}=\mathbf{4 . 9 8 \times 1 0}{ }^{\mathbf{2 v}}$ atoms
(iii) 0.23 g of Oxygen gas

Molar mass of $\mathrm{O}_{2}=(2 \mathrm{x} 16)=\mathbf{3 2 . 0} \mathrm{g}$

## Method I

$$
\text { Moles }=\frac{\text { mass in grams }}{\text { Molar mass }}=>\frac{0.23 \mathrm{~g}}{32}=\mathbf{0 . 0 0 7 1 8 m o l e s ~} /
$$

1 mole has $2 \times 6.0 \times 10^{23}$ atoms in $\mathrm{O}_{2}$
$7.18 \times 10^{-3}$ moles has $\left(\underline{7.18 \times 10^{-3} \text { moles x }} \underline{\mathbf{2}} \times \underline{\left.6.0 \times 10^{23}\right)=\mathbf{8 . 6 1 6} \times 10^{\mathbf{2 1}} \text { atoms }, ~}\right.$

## Method II

$32.0 \mathrm{~g}=1$ mole has $2 \times 6.0 \times 10^{23}$ atoms in $\mathrm{O}_{2}$
0.23 g therefore has $\left.\frac{\left(0.23 \mathrm{~g} \mathrm{x} \mathrm{2} \mathrm{x} 6.0 \times 10^{23}\right.}{32.0}\right)=\mathbf{8 . 6 1 6 \times 1 0} \mathbf{2 1}^{\mathbf{a t o m s}}$
(iv) 0.23 g of Carbon(IV)oxide gas

Molar mass of $\mathrm{CO}_{2}=[12+(2 \times 16)]=44.0 \mathrm{~g}$
Method I
Moles $=\frac{\text { mass in grams }}{\text { Molar mass }}=>\frac{0.23 \mathrm{~g}}{44} \quad=\mathbf{0 . 0 0 5 2 2 m o l e s ~} /$
1 mole has $3 \times 6.0 \times 10^{23}$ atoms in $\mathrm{CO}_{2}$
$7.18 \times 10^{-3}$ moles has $\left(\underline{\left.5.22 \times 10^{-3} \text { moles x } \underline{\mathbf{3}} \times 6.0 \times 10^{23}\right)=\mathbf{9 . 3 9 6} \times 10^{\mathbf{2 1}} \text { atoms }, ~}\right.$

## Method II

$44.0 \mathrm{~g}=1$ mole has $3 \times 6.0 \times 10^{23}$ atoms in $\mathrm{CO}_{2}$
0.23 g therefore has $\left(\underline{0.23 \mathrm{~g} \mathrm{x}} \underline{3} \underline{\left.\times 6.0 \times 10^{23}\right)}=\mathbf{9 . 4 0 9 \times 1 0} \mathbf{1 0}^{\mathbf{2 1}}\right.$ atoms

## (c)Empirical and molecular formula

1.The empirical formula of a compound is its simplest formula. It is the simplest whole number ratios in which atoms of elements combine to form the compound. 2.It is mathematically the lowest common multiple (LCM) of the atoms of the elements in the compound
3.Practically the empirical formula of a compound can be determined as in the following examples.

## To determine the empirical formula of copper oxide

(a)Method 1:From copper to copper(II)oxide

Procedure.
Weigh a clean dry covered crucible( $\mathbf{M}_{1}$ ).Put two spatula full of copper powder into the crucible. Weigh again ( $\mathbf{M}_{2}$ ).Heat the crucible on a strong Bunsen flame for five minutes. Lift the lid, and swirl the crucible carefully using a pair of tong. Cover the crucible and continue heating for another five minutes. Remove the lid and stop heating. Allow the crucible to cool. When cool replace the lid and weigh the contents again (M3).

## Sample results

| Mass of crucible $\left(\mathbf{M}_{1}\right)$ | 15.6 g |
| :--- | :--- |
| Mass of crucible $+\operatorname{copper}$ before heating $\left(\mathbf{M}_{\mathbf{2}}\right)$ | 18.4 |
| Mass of crucible + copper after heating $\left(\mathbf{M}_{\mathbf{3}}\right)$ | 19.1 |

## Sample questions

## 1. Calculate the mass of copper powder used.

## 2. Calculate the mass of Oxygen used to react with copper.

 Method I$$
\text { Mass of crucible }+ \text { copper after heating }\left(\mathbf{M}_{3}\right)=19.1 \mathrm{~g}
$$

Method II

$$
\begin{array}{ll}
\text { Mass of crucible }+ \text { copper before heating }\left(\mathbf{M}_{2}\right) & =-18.4 \mathrm{~g} \\
& =\overline{\mathbf{0 . 7} \mathbf{g}} \\
& \\
\text { Mass of Oxygen } & =-19.1 \mathrm{~g} \\
\text { Mass of crucible + copper after heating }\left(\mathbf{M}_{3}\right) & =-\underline{15.6 \mathrm{~g}} \\
\text { Mass of crucible } & =-3.5 \mathrm{~g} \\
\text { Mass of copper(II)Oxide } & =-2.5 \mathrm{~g} \\
\text { Mass of copper(II)Oxide } & =-\overline{\mathbf{0 . 7} \mathbf{g}}
\end{array}
$$

3. Calculate the number of moles of:
(i) copper used ( $\mathrm{Cu}=63.5$ )
number of moles of copper $=\frac{\text { mass used }}{\text { Molar mass }} \Rightarrow \underline{2.8}=\underline{\mathbf{0 . 0 4 4 1 m o l e s}}$
(ii) Oxygen used $(\mathrm{O}=16.0)$
number of moles of oxygen $=\frac{\text { mass used }}{\text { Molar mass }} \Rightarrow \frac{0.7}{16.0}=\underline{\mathbf{0 . 0 4 4 1} \mathrm{moles}}$

## 4. Determine the mole ratio of the reactants

$\begin{aligned} & \text { Moles of copper } \\ & \text { Moles of oxygen }\end{aligned}=\frac{0.0441 \text { moles }}{0.0441 \mathrm{moles}}=\frac{1}{1} \quad \Rightarrow$ Mole ratio $\mathrm{Cu}: \mathrm{O}=\mathbf{1}: \mathbf{1}$
5.What is the empirical, formula of copper oxide formed.

CuO (copper(II)oxide
6. State and explain the observations made during the experiment. Observation

Colour change from brown to black

## Explanation

Copper powder is brown. On heating it reacts with oxygen from the air to form black copper(II)oxide
7. Explain why magnesium ribbon/shavings would be unsuitable in a similar experiment as the one above.
Hot magnesium generates enough heat energy to react with both Oxygen and Nitrogen in the air forming a white solid mixture of Magnesuin oxide and magnesium nitride. This causes experimental mass errors.
(b)Method 2:From copper(II)oxide to copper

## Procedure.

Weigh a clean dry porcelain boat ( $\mathbf{M}_{1}$ ). Put two spatula full of copper(II)oxide powder into the crucible. Reweigh the porcelain boat ( $\mathbf{M}_{2}$ ).Put the porcelain boat in a glass tube and set up the apparatus as below;

Determining empirical formula from copper(II)oxide to copper

Pass slowly(to prevent copper(II)oxide from being blown away)a stream of either dry Hydrogen /ammonia/laboratory gas/ carbon(II)oxide gas for about two minutes from a suitable generator.
When all the in the apparatus set up is driven out ,heat the copper(II)oxide strongly for about five minutes until there is no further change. Stop heating. Continue passing the gases until the glass tube is cool.
Turn off the gas generator.
Carefully remove the porcelain boat form the combustion tube.
Reweigh (M3).
Sample results

| Mass of boat(M1) | 15.6 g |
| :--- | :--- |
| Mass of boat before heating $\left(\mathbf{M}_{2}\right)$ | 19.1 |
| Mass of boat after heating $\left(\mathbf{M}_{3}\right)$ | 18.4 |

## Sample questions

1. Calculate the mass of copper(II)oxide used.
$\begin{array}{lr}\text { Mass of boat before heating }\left(\mathbf{M}_{2}\right) & =\begin{array}{r}19.1 \\ \text { Mass of empty boat }\left(\mathbf{M}_{1}\right)\end{array} \\ \begin{array}{lr}\text { Mass of copper }(\mathrm{II}) \text { Oxide }\end{array} & \mathbf{3 . 5 \mathrm { g }}\end{array}$
2. Calculate the mass of
(i) Oxygen.

Mass of boat before heating $\left(\mathbf{M}_{2}\right)=19.1$
Mass of boat after heating $\left(\mathrm{M}_{3}\right) \quad=-18.4 \mathrm{~g}$
Mass of oxygen
$=0.7 \mathrm{~g}$
(ii) Copper

Mass of copper(II)Oxide $\quad=3.5 \mathrm{~g}$
Mass of oxygen $\quad=0.7 \mathrm{~g}$
Mass of oxygen $\quad=\mathbf{2 . 8} \mathbf{g}$
3. Calculate the number of moles of:
(i) Copper used $(\mathbf{C u}=63.5)$
number of moles of copper $=\frac{\text { mass used }}{\text { Molar mass }} \Rightarrow \underline{2.8} 63.5=\underline{\mathbf{0 . 0 4 4 1}} \underset{ }{\text { moles }}$
(ii) Oxygen used $(O=16.0)$
number of moles of oxygen $=\frac{\text { mass used }}{\text { Molar mass }} \Rightarrow \frac{0.7}{16.0}=\underline{\mathbf{0 . 0 4 4 1 m o l e s}}$
4. Determine the mole ratio of the reactants
$\begin{aligned} & \text { Moles of copper } \\ & \text { Moles of oxygen }\end{aligned}=\frac{0.0441 \mathrm{moles}}{0.0441 \mathrm{moles}}=\frac{1}{1} \quad \Rightarrow$ Mole ratio $\mathrm{Cu}: \mathrm{O}=\mathbf{1}: 1$
5.What is the empirical, formula of copper oxide formed.

CuO (copper(II)oxide

## 6. State and explain the observations made during the

 experiment. ObservationColour change from black to brown
Explanation
Copper(II)oxide powder is black. On heating it is reduced by a suitable reducing agent to brown copper metal.
7. Explain why magnesium oxide would be unsuitable in a similar experiment as the one above.
Magnesium is high in the reactivity series. None of the above reducing agents is strong enough to reduce the oxide to the metal.
8. Write the equation for the reaction that would take place when the reducing agent is:
(i) Hydrogen
$\mathrm{CuO}(\mathrm{s}) \quad+\quad \mathrm{H}_{2}(\mathrm{~g})->\quad \mathrm{Cu}(\mathrm{s}) \quad+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
(Black)
(brown) (colourless liquid form on cooler parts )
(ii)Carbon(II)oxide
$\mathrm{CuO}(\mathrm{s})+\mathrm{CO}(\mathrm{g}) \quad->\quad \mathrm{Cu}(\mathrm{s}) \quad+\mathrm{CO}_{2}(\mathrm{~g})$
(Black) (brown) (colourless gas, form white ppt with lime water )
(iii)Ammonia
$3 \mathrm{CuO}(\mathrm{s})+\quad 2 \mathrm{NH}_{3}(\mathrm{~g}) \quad->\quad 3 \mathrm{Cu}(\mathrm{s})+\mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
(Black)
(brown) (colourless liquid form on cooler parts )
9. Explain why the following is necessary during the above experiment;
(i)A stream of dry hydrogen gas should be passed before heating copper (II) Oxide.

Air combine with hydrogen in presence of heat causing an explosion
(ii)A stream of dry hydrogen gas should be passed after heating copper (II) Oxide has been stopped.

Hot metallic copper can be re-oxidized back to copper(II)oxide
(iii) A stream of excess carbon (II)oxide gas should be ignited to burn Carbon (II)oxide is highly poisonous/toxic. On ignition it burns to form less toxic carbon (IV)oxide gas.
10. State two sources of error in this experiment.
(i)All copper(II)oxide may not be reduced to copper.
(ii)Some copper(II)oxide may be blown out the boat by the reducing agent.
4.Theoreticaly the empirical formula of a compound can be determined as in the following examples.
(a)A oxide of copper contain $80 \%$ by mass of copper. Determine its empirical formula. $(\mathrm{Cu}=63.5,16.0)$
$\%$ of Oxygen $=100 \%-\%$ of Copper $=>100-80=\mathbf{2 0 \%}$ of Oxygen

| Element | Copper | Oxygen |
| :--- | :--- | :--- |
| Symbol | Cu | O |
| Moles present $=\frac{\% \text { composition }}{\text { Molar mass }}$ | $\underline{80}$ | $\frac{20}{16}$ |
| Divide by the smallest value | $\underline{63.5}$ | $\frac{1.25}{1.25}$ |
| Mole ratios | 1 | $\frac{1.25}{1.25}$ |

Empirical formula is $\mathbf{C u O}$
(b) 1.60 g of an oxide of Magnesium contain 0.84 g by mass of Magnesium. Determine its empirical formula( $\mathbf{M g}=\mathbf{2 4 . 0}, 16.0$ )
Mass of Oxygen $=1.60-0.84=>\mathbf{0 . 5 6} \mathbf{g}$ of Oxygen

| Element | Magnesium | Oxygen |
| :--- | :--- | :--- |
| Symbol | Mg | O |
| Moles present $=\frac{\% \text { composition }}{\text { Molar mass }}$ | $\frac{0.84}{24}$ | $\frac{0.56}{16}$ |
| Divide by the smallest value | $\underline{0.35}$ | $\frac{0.35}{0.35}$ |
| Mole ratios | 1 | 1 |

Empirical formula is $\mathbf{M g O}$
(c)An oxide of Silicon contain $47 \%$ by mass of Silicon. What is its empirical formula( $\mathbf{S i}=\mathbf{2 8 . 0}, 16.0$ )

Mass of Oxygen $=100-47$ => 53\% of Oxygen

| Element | Silicon | Oxygen |
| :--- | :--- | :--- |
| Symbol | Si | O |
| Moles present $=\frac{\% \text { composition }}{\text { Molar mass }}$ | $\frac{47}{28}$ | $\frac{53}{16}$ |
| Divide by the smallest value | $\frac{1.68}{1.68}$ | $\frac{3.31}{1.68}$ |
| Mole ratios | 1 | $1.94=2$ |

Empirical formula is $\mathbf{S i O}_{2}$
(d)A compound contain $\mathbf{7 0 \%}$ by mass of Iron and $\mathbf{3 0 \%}$ Oxygen. What is its empirical formula $(\mathrm{Fe}=56.0,16.0)$
Mass of Oxygen $=100-47$ => 53\% of Oxygen

| Element | Silicon | Oxygen |
| :--- | :--- | :--- |
| Symbol | Si | O |
| Moles present $=\frac{\% \text { composition }}{\text { Molar mass }}$ | $\frac{47}{28}$ | $\frac{53}{16}$ |
| Divide by the smallest value | $\frac{1.68}{1.68}$ | $\frac{3.31}{1.68}$ |
| Mole ratios | 1 | $1.94=2$ |

Empirical formula is $\mathbf{S i O}_{2}$
2.During heating of a hydrated copper (II)sulphate(VI) crystals, the following readings were obtained:
Mass of evaporating dish $=\mathbf{3 0 0 . 0 g}$
Mass of evaporating dish + hydrated salt $=305.0 \mathrm{~g}$
Mass of evaporating dish + anhydrous salt $=303.2 \mathrm{~g}$
Calculate the number of water of crystallization molecules in hydrated copper (II)sulphate(VI)
( $\mathrm{Cu}=64.5, \mathrm{~S}=32.0, \mathrm{O}=16.0, \mathrm{H}=1.0$ )
Working
Mass of Hydrated salt $=305.0 \mathrm{~g}-300.0 \mathrm{~g}=\mathbf{5 . 0 g}$
Mass of anhydrous salt $=303.2 \mathrm{~g}-300.0 \mathrm{~g}=\mathbf{3 . 2 \mathrm { g }}$
Mass of water in hydrated salt $=5.0 \mathrm{~g}-3.2 \mathrm{~g}=\underline{\mathbf{1 . 8 g}}$
Molar mass of water $\left(\mathrm{H}_{2} \mathrm{O}\right)=\mathbf{1 8 . 0 g}$
Molar mass of anhydrous copper (II)sulphate(VI) $\left(\mathrm{CuSO}_{4}\right)=\mathbf{1 6 0 . 5 g}$

| Element/compound | anhydrous copper (II) <br> sulphate(VI) | Oxygen |
| :--- | :--- | :--- |
| Symbol | Si | O |
| Moles present $=\frac{\text { composition by mass }}{\text { Molar mass }}$ | $\frac{3,2}{160.5}$ | $\frac{1.8}{18}$ |
| Divide by the smallest value | $\frac{0.0199}{0.0199}$ | $\frac{0.1}{18}$ |
| Mole ratios | 1 | 5 |

The empirical formula of hydrated salt $=\mathrm{CuSO}_{4} \cdot \mathbf{5} \mathrm{H}_{2} \mathrm{O}$

Hydrated salt has five $\mathbf{5}$ molecules of water of crystallizations
4. The molecular formula is the actual number of each kind of atoms present in a molecule of a compound.

The empirical formula of an ionic compound is the same as the chemical formula but for simple molecular structured compounds, the empirical formula may not be the same as the chemical formula.

The molecular formula is a multiple of empirical formula .It is determined from the relationship:

$$
\begin{equation*}
\mathrm{n}=\frac{\text { Relative formular mass }}{\text { Relative empirical formula }} \tag{i}
\end{equation*}
$$

where $\mathbf{n}$ is a whole number.
(ii) Relative empirical formula $\mathrm{x} \mathbf{n}=$ Relative formular mass where n is a whole number.

## Practice sample examples

1. A hydrocarbon was found to contain $\mathbf{9 2 . 3 \%}$ carbon and the remaining Hydrogen.
If the molecular mass of the compound is 78, determine the molecular formula( $\mathrm{C}=12.0, \mathrm{H}=1.0$ )

Mass of Hydrogen $=100-92.3=>7.7 \%$ of Oxygen

| Element | Carbon | Hydrogen |
| :--- | :--- | :--- |
| Symbol | C | H |
| Moles present $=\frac{\% \text { composition }}{\text { Molar mass }}$ | $\frac{92.3}{12}$ | $\frac{7.7}{1}$ |
| Divide by the smallest value | $\frac{7.7}{7.7}$ | $\frac{7.7}{7.7}$ |
| Mole ratios | 1 | 1 |

Empirical formula is $\mathbf{C H}$
The molecular formular is thus determined :

$$
\mathbf{n}=\underline{\text { Relative formular mass }} \quad=\underline{78}=6
$$

The molecular formula is (C H ) $\times 6=\underline{\mathbf{C}_{6}} \underline{\mathbf{H}} \mathbf{6}$
2. A compound of carbon, hydrogen and oxygen contain $54.55 \%$ carbon, $\mathbf{9 . 0 9 \%}$ and remaining $36.36 \%$ oxygen.
If its relative molecular mass is 88 , determine its molecular formula( $\mathrm{C}=12.0$, $\mathrm{H}=1.0, \mathrm{O}=16.0$ )

| Element | Carbon | Hydrogen | Oxygen |
| :--- | :--- | :--- | :--- |
| Symbol | C | H | O |
| Moles present $=\frac{\% \text { composition }}{\text { Molar mass }}$ | $\frac{54.55}{12}$ | $\frac{9.09}{1}$ | $\frac{36.36}{16}$ |
| Divide by the smallest value | $\frac{4.5458}{2.2725}$ | $\frac{9.09}{2.2725}$ | $\frac{2.2725}{2.2725}$ |
| Mole ratios | 2 | 4 | 1 |

Empirical formula is $\mathbf{C}_{\mathbf{2}} \mathbf{H}_{\mathbf{4}} \mathbf{O}$
The molecular formula is thus determined :

$$
\mathrm{n}=\frac{\text { Relative formular mass }}{\text { Relative empirical formula }} \quad=\frac{88}{44} \quad=2
$$

The molecular formula is $\left(\mathrm{C}_{2} \mathrm{H}_{4} \mathrm{O}\right) \times 2=\mathbf{C} 4 \mathbf{H}_{8} \mathrm{O}_{2}$.
4.A hydrocarbon burns completely in excess air to form 5.28 g of carbon (IV) oxide and $2,16 \mathrm{~g}$ of water.

If the molecular mass of the hydrocarbon is 84, draw and name its molecular structure.

Since a hydrocarbon is a compound containing Carbon and Hydrogen only. Then:
Mass of carbon in $\mathrm{CO}_{2}=\quad$ Mass of C in $\mathrm{CO}_{2} 2 \mathrm{x}$ mass of $\mathrm{CO}_{2} \quad \Rightarrow$

$$
\text { Molar mass of } \mathrm{CO}_{2}
$$

$\frac{12 \times 5.28=}{44} \quad \mathbf{1 . 4 4 g} \sqrt{ }$
Mass of Hydrogen in $\mathrm{H}_{2} \mathrm{O}=\quad \frac{\text { Mass of } \mathrm{C} \text { in } \mathrm{H}_{2} \mathrm{O}}{\text { Molar mass of } \mathrm{H}_{2} \mathrm{O}} \times$ mass of $\mathrm{H}_{2} \mathrm{O} \quad \Rightarrow$

$$
2 \underline{x 2.16}=\mathbf{0 . 2 4 g} \sqrt{ } 18
$$

| Element | Carbon | Hydrogen |
| :--- | :--- | :--- |

| Symbol | C | H |
| :--- | :--- | :--- |
| Moles present $=\frac{\mathrm{mass}}{\text { Molar mass }}$ | $\underline{1 . \underline{44 \mathrm{~g}}}$ | $\underline{0 . \underline{\underline{g} \mathrm{~g}} \mathrm{~V}}$ |
| Divide by the smallest value | $\frac{0.12}{0.12}$ | $\frac{0.24}{0.12}$ |
|  | 1 | $2 \sqrt{ }$ |
| Mole ratios | 1 |  |

Empirical formula is $\mathbf{C H}_{2} \sqrt{ }$
The molecular formular is thus determined :

$$
\mathrm{n}=\frac{\text { Relative formular mass }}{\text { Relative empirical formula }}=84=\mathbf{6} \mathrm{V}
$$

The molecular formula is $\left(\mathrm{CH}_{2}\right) \times 6=\mathbf{C}_{6} \mathbf{H}_{12} . \sqrt{ }$ molecular name Hexene $\sqrt{ } / \underline{\text { Hex-1-ene }}$ (or any position isomer of Hexene) Molecular structure

5. Compound A contain $\mathbf{5 . 2 \%}$ by mass of Nitrogen .The other elements present are Carbon, hydrogen and Oxygen. On combustion of 0.085 g of A in excess Oxygen, 0.224 g of carbon(IV)oxide and 0.0372 g of water was formed.
Determine the empirical formula of $\mathrm{A}(\mathrm{N}=14.0, \mathrm{O}=16.0, \mathrm{C}=\mathbf{1 2 . 0}, \mathrm{H}=1.0)$

$$
\begin{aligned}
\text { Mass of } \mathrm{N} \text { in } \mathrm{A} & =5.2 \% \times 0.085=\underline{\mathbf{0 . 0 0 4 4 2} \mathrm{g}} \\
\text { Mass of } \mathrm{C} \text { in } \mathrm{A} & =\frac{12}{44} \quad \times 0.224 \quad=\underline{\mathbf{0 . 0 6 1 1 g}} \\
\text { Mass of } \mathrm{H} \text { in } \mathrm{A} & =\frac{2}{18} \quad \times 0.0372 \quad=\underline{\mathbf{0 . 0 0 4 1} \mathrm{g}} \\
\text { Mass of O in A } & =0.085 \mathrm{~g}-0.004442 \mathrm{~g}=\underline{\mathbf{0 . 0 8 0 6 g}} \text { (Mass of C,H,O) } \\
& =0.0611 \mathrm{~g}+0.0041 \mathrm{~g}=\underline{\mathbf{0 . 0 6 5 2 g}} \text { (Mass of C,H) } \\
& 0.0806 \mathrm{~g} \text { (Mass of C,H,O)- }-0.0652 \mathrm{~g}(\text { Mass of } \mathrm{C}, \mathrm{H})=\mathbf{0 . 0 1 5 4} \mathbf{~ g}
\end{aligned}
$$

| Element | Nitrogen | Carbon | Hydrogen | Oxygen |

## (d)Molar gas volume

The volume occupied by one mole of all gases at the same temperature and pressure is a constant.It is:
(i) $24 \mathrm{dm} 3 / 24$ litres $/ 24000 \mathrm{~cm} 3$ at room temperature $\left(25^{\circ} \mathrm{C} / 298 \mathrm{~K}\right)$ and pressure(r.t.p).
i.e. 1 mole of all gases $=24 \mathrm{dm} 3 / 24$ litres $/ 24000 \mathrm{~cm} 3$ at r.t.p

Examples
1mole of $\mathbf{O}_{\mathbf{2}}=32 \mathrm{~g}=6.0 \times 10^{23}$ particles= 24dm3/24litres $/ \mathbf{2 4 0 0 0} \mathbf{c m} 3$ at r.t.p 1mole of $\mathbf{H}_{2}=2 \mathrm{~g}=6.0 \times 10^{23}$ particles $=\mathbf{2 4 d m} \mathbf{3} / \mathbf{2 4 l i t r e s} / \mathbf{2 4 0 0 0} \mathbf{c m} 3$ at r.t.p 1mole of $\mathbf{C O}_{2}=44 \mathrm{~g}=6.0 \times 10^{23}$ particles $=\mathbf{2 4 d m} \mathbf{3} / \mathbf{2 4 l i t r e s} / \mathbf{2 4 0 0 0} \mathbf{c m} 3$ at r.t.p 1mole of $\mathbf{N H}_{\mathbf{3}}=17 \mathrm{~g}=6.0 \times 10^{23}$ particles $=\mathbf{2 4 d m} 3 / 24$ litres $/ 24000 \mathrm{~cm} 3$ at r.t.p 1mole of $\mathbf{C H}_{4}=16 \mathrm{~g}=6.0 \times 10^{23}$ particles $=\mathbf{2 4 d m} 3 / 24 l i t r e s / 24000 \mathrm{~cm} 3$ at r.t.p
(ii) $22.4 \mathrm{dm} 3 / 22.41$ itres $/ 22400 \mathrm{~cm} 3$ at standard temperature $\left(0^{\circ} \mathrm{C} / 273 \mathrm{~K}\right)$ and pressure(s.t.p)
i.e. 1 mole of all gases $=22.4 \mathrm{dm} 3 / 22.4$ litres $/ 22400 \mathrm{~cm} 3$ at
s.t.p Examples

1mole of $\mathbf{O}_{\mathbf{2}}=32 \mathrm{~g}=6.0 \times 10^{23}$ particles $=\mathbf{2 2 . 4} \mathbf{d m} \mathbf{3} / \mathbf{2 2} .4 \mathrm{litres} / \mathbf{2 2 4 0 0} \mathbf{c m} 3$ at s.t.p 1mole of $\mathbf{H}_{\mathbf{2}}=2 \mathrm{~g}=6.0 \times 10^{23}$ particles $=\mathbf{2 2 . 4 d m} \mathbf{3} / \mathbf{2 2} .4$ litres $/ \mathbf{2 2 4 0 0} \mathbf{c m} 3$ at s.t.p 1mole of $\mathbf{C O}_{\mathbf{2}}=44 \mathrm{~g}=6.0 \times 10^{23}$ particles $=\mathbf{2 2 . 4} \mathbf{d m} 3 / \mathbf{2 2}$.4litres $/ \mathbf{2 2 4 0 0} \mathbf{c m} 3$ at s.t.p 1 mole of $\mathbf{N H}_{3}=17 \mathrm{~g}=6.0 \times 10^{23}$ particles= 22.4dm3/22.4litres $/ \mathbf{2 2 4 0 0} \mathbf{c m} 3$ at s.t.p 1mole of $\mathbf{C H}_{\mathbf{4}}=16 \mathrm{~g}=6.0 \times 10^{23}$ particles $=\mathbf{2 2 . 4} \mathbf{4 m} \mathbf{3} / \mathbf{2 2} .4$ litres $/ \mathbf{2 2 4 0 0} \mathbf{~} \mathbf{~} 33$ at s.t.p The volume occupied by one mole of a gas at r.t.p or s.t.p is commonly called the molar gas volume. Whether the molar gas volume is at r.t.p or s.t.p must always be specified.
From the above therefore a less or more volume can be determined as in the examples below.

## Practice examples

## 1. Calculate the number of particles present in:

(Avogadros constant $=6.0 \times 10^{23} \mathrm{~mole}^{-1}$ )
(i) 2.24dm3 of Oxygen.

$$
\begin{aligned}
& 22.4 \mathrm{dm} 3->6.0 \times 10^{23} \\
& 2.24 \mathrm{dm} 3 \text {-> } \\
& \\
&=6.24 \times 6.0 \times 10^{23} \\
& 22.4 \\
& \text { molecules }=2 \times 6.0 \times 10^{22 .}=1.2 \times 10^{23} \text { atoms }
\end{aligned}
$$

(ii) 2.24dm3 of Carbon(IV)oxide.

$$
\begin{array}{rll}
22.4 \mathrm{dm} 3 & -> & 6.0 \times 10^{23} \\
2.24 \mathrm{dm} 3 & \rightarrow & \frac{2.24 \times 6.0 \times 10^{23}}{22.4} \\
=\underline{6.0 \times 10^{22}} \text { molecules } & =\begin{array}{c}
\left(\mathrm{CO}_{2}\right)=3 \times 6.0 \times 10^{22} \\
\text { atoms }
\end{array} & =\quad \underline{1.8 \times 10^{23}}
\end{array}
$$

2. 0.135 g of a gaseous hydrocarbon X on complete combustion produces 0.41 g of carbon(IV)oxide and 0.209 g of water. 0.29 g of $X$ occupy 120 cm 3 at room temperature and 1 atmosphere pressure .Name $X$ and draw its molecular structure. $(\mathbf{C}=\mathbf{1 2 . 0 , O}=\mathbf{1 6 . 0}, \mathrm{H}=\mathbf{1 . 0 , 1}$ mole of gas occupies 24 dm 3 at r.t.p) Molar mass $\mathrm{CO}_{2}=44$ gmole $^{-1} \sqrt{ }$ Molar mass $\mathrm{H}_{2} \mathrm{O}=18 \mathrm{gmole}^{-1} \sqrt{ }$ Molar mass $\mathrm{X}=$

$$
\frac{0.29 \times(24 \times 1000) \mathrm{cm} 3}{120 \mathrm{~cm} 3}=58 \text { gmole }^{-1} \sqrt{ }
$$

Since a hydrocarbon is a compound containing Carbon and Hydrogen only. Then: Mass of carbon in $\mathrm{CO}_{2}=\quad$ Mass of C in $\mathrm{CO}_{2} \mathrm{x}$ mass of $\mathrm{CO}_{2} \quad \Rightarrow$

$$
\text { Molar mass of } \mathrm{CO}_{2}
$$

$$
\frac{12 \times 0.41=}{44} \quad \mathbf{0 . 1 1 1 8 g} \sqrt{ }
$$

Mass of Hydrogen in $\mathrm{H}_{2} \mathrm{O}=\quad \frac{\text { Mass of } \mathrm{C} \text { in } \mathrm{H}_{2} \mathrm{O} \text { x }}{\text { Molar mass of } \mathrm{H}_{2} \mathrm{O}} \quad$ mass of $\mathrm{H}_{2} \mathrm{O} \quad \Rightarrow$

$$
2 \underline{\mathrm{x} 0.209}=\mathbf{0 . 0 2 3 2 g} \sqrt{ } 18
$$

| Element | Carbon | Hydrogen |
| :--- | :--- | :--- |
| Symbol | C | H |
| Moles present $=\frac{\% \text { composition }}{\text { Molar mass }}$ | $\frac{0 . \mathrm{g} 118}{12}$ | $\frac{0.0232 \mathrm{~g} \sqrt{1}}{1}$ |

The molecular formula is $\left(\mathbf{C}_{\mathbf{2}} \mathbf{H}_{5}\right) \times 2=\mathbf{\mathbf { C } _ { 4 }} \mathbf{H}_{\mathbf{1 0}} \cdot \sqrt{ }$
Molecule name Butane
Molecula structure

## (e)Gravimetric analysis

Gravimetric analysis is the relationship between reacting masses and the volumes and /or masses of products. All reactants are in mole ratios to their products in accordance to their stoichiometric equation. Using the mole ration of reactants and products any volume and/or mass can be determined as in the examples:

1. Calculate the volume of carbon(IV)oxide at r.t.p produced when 5.0 g of calcium carbonate is strongly heated. $(\mathrm{Ca}=40.0, \mathrm{C}=12.0, \mathrm{O}=16.0,1$ mole of gas $=22.4$ at r.t.p)
Chemical equation

|  | $\mathrm{CaCO}_{3}(\mathrm{~s})$ | $->\mathrm{CaO}(\mathrm{s})$ | + | $\mathrm{CO}_{2}(\mathrm{~g})$ |
| :---: | :---: | :---: | :---: | :---: |
| Mole ratios | $1:$ | $1:$ |  | 1 |

Molar Mass $\mathrm{CaCO}_{3}=100 \mathrm{~g}$
Method 1
$100 \mathrm{~g} \mathrm{CaCO}_{3}(\mathrm{~s}) \quad->24 \mathrm{dm}_{3} \mathrm{CO}_{2}(\mathrm{~g})$ at r.t.p
$5.0 \mathrm{~g} \mathrm{CaCO}_{3}(\mathrm{~s}) \quad->\frac{5.0 \mathrm{~g} \mathrm{x} \mathrm{24dm3}}{100 \mathrm{~g}}=\underline{\mathbf{1 . 2 \mathbf { d m } 3 / 1 2 0 0 \mathrm { cm } 3}}$
Method 2

Moles of $5.0 \mathrm{~g} \mathrm{CaCO}_{3}(\mathrm{~s})=5.0 \mathrm{~g}=\mathbf{0 . 0 5}$ moles 100 g

Mole ratio 1:1
Moles of $\mathrm{CO}_{2}(\mathrm{~g})=\mathbf{0 . 0 5}$ moles
Volume of $\mathrm{CO}_{2}(\mathrm{~g})=0.05 \times 24000 \mathrm{~cm} 3=\underline{\mathbf{1 2 0 0} \mathbf{c m 3} / \mathbf{1 . 2 d m 3}}$
2. 1.0 g of an alloy of aluminium and copper were reacted with excess hydrochloric acid. If 840 cm 3 of hydrogen at s.t.p was produced, calculate the \% of copper in the alloy. $(\mathbf{A l}=\mathbf{2 7 . 0}$, one mole of a gas at $\mathrm{s} . \mathrm{t} \cdot \mathrm{p}=\mathbf{2 2 . 4 \mathrm { dm } 3 )}$

## Chemical equation

Copper does not react with hydrochloric acid

$$
2 \mathrm{Al}(\mathrm{~s})+6 \mathrm{HCl}(\mathrm{aq})->2 \mathrm{AlCl}_{3}(\mathrm{aq})+3 \mathrm{H}_{2}(\mathrm{~g})
$$

Method 1
$3 \mathrm{H}_{2}(\mathrm{~g})=3$ moles $\mathrm{x}(22.4 \times 1000) \mathrm{cm} 3 \Rightarrow 2 \times 27 \mathrm{~g} \mathrm{Al}$

$$
840 \mathrm{~cm} 3 \quad=\frac{840 \mathrm{~cm} 3 \times 2 \times 27}{3 \times 22.4 \times 1000}=\mathbf{0 . 6 7 5} \mathrm{g} \text { of Aluminium }
$$

Total mass of alloy - mass of aluminium $=$ mass of copper

$$
\text { => } 1.0 \mathrm{~g}-0.675 \mathrm{~g}=\mathbf{0 . 3 2 5} \mathrm{g} \text { of copper }
$$

$\%$ copper $=\frac{\text { mass of copper } x 100 \%}{\text { Mass of alloy }}=\mathbf{3 2 . 5 \%}$
Method 2
Mole ratio $2 \mathrm{Al}: 3 \mathrm{H}_{2}=2: 3$
Moles of Hydrogen gas $=$ volume of gas $\Rightarrow \quad 840 \mathrm{~cm} 3=\mathbf{0 . 0 3 7 5 m o l e s}$ Molar gas volume $\quad 22400 \mathrm{~cm} 3$

Moles of $\mathrm{Al}=2 / 3$ moles of $\mathrm{H}_{2} \Rightarrow 2 / 3 \times 0.0375$ moles $=\mathbf{0 . 0 2 5}$ moles
Mass of $\mathrm{Al}=$ moles $\times$ molar mass $=>0.025$ moles $\times 27=\underline{\mathbf{0 . 6 7 5} \mathbf{g}}$
Total mass of alloy - mass of aluminium $=$ mass of copper

$$
\Rightarrow 1.0 \mathrm{~g}-0.675 \mathrm{~g}=\underline{\mathbf{0 . 3 2 5}} \mathrm{g} \text { of copper }
$$

$\%$ copper $=\frac{\text { mass of copper } x 100 \%}{\text { Mass of alloy }}=\underline{\mathbf{3 2 . 5 \%}}$

## (f)Gay Lussac's law

Gay Lussacs law states that "when gases combine/react they do so in simple volume ratios to each other and to their gaseous products at constant/same temperature and pressure"
Gay Lussacs law thus only apply to gases
Given the volume of one gas reactant, the other gaseous reactants can be deduced thus:

## Examples

1. Calculate the volume of Oxygen required to completely react with 50 cm 3 of Hydrogen.
Chemical equation: $2 \underset{2}{2 \mathrm{H}_{2}}(\mathrm{~g}) \quad+\quad \mathrm{O}_{2}(\mathrm{~g}) \quad->\quad 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
$\begin{array}{llllll}\text { Volume ratios } & 2 & : & 1 & : & 0\end{array}$
Reacting volumes 50 cm 3 : $\quad \mathbf{2 5 c m} 3$
50 cm 3 of Oxygen is used
2. Calculate the volume of air required to completely reacts with 50 cm 3 of Hydrogen.(assume Oxygen is $21 \%$ by volume of air)

Chemical equation: $2 \mathrm{H}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \quad->2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$

Volume ratios $2 \quad: \quad 1 \quad 0$
Reacting volumes
50 cm 3 : $\quad 25 \mathrm{~cm} 3$
50 cm 3 of Oxygen is used
$21 \%=25 \mathrm{~cm} 3$
$100 \%=\frac{100 \times 25}{21}=$
3.If 5 cm 3 of a hydrocarbon $\mathrm{C}_{\mathrm{x}} \mathrm{H}_{\mathrm{y}}$ burn in 15 cm 3 of Oxygen to form 10 cm 3 of Carbon(IV)oxide and 10 cm 3 of water vapour/steam, obtain the equation for the reaction and hence find the value of $x$ and $y$ in $\mathrm{C}_{x} \mathrm{H}_{y}$.

| Chemical equation: | $\mathrm{C}_{\mathrm{x}} \mathrm{Hyy}^{\text {(g) }}$ ) | + | $\mathrm{O}_{2}(\mathrm{~g})$ | -> | $\mathrm{H}_{2} \mathrm{O}(\mathrm{g})+\mathrm{CO}_{2}(\mathrm{~g})$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Volumes | 5 cm 3 | : | 15 cm 3 |  | $10 \mathrm{~cm} 3: 10 \mathrm{~cm} 3$ |
| Volume ratios | $\underline{5 c m 3}$ | . | $\underline{15} \mathrm{~cm} 3$ | : | $\underline{10 \mathrm{~cm} 3} 5: \underline{10 \mathrm{~cm} 3}$ |
| (divide by lowest volume) | 5 |  | 5 |  | 5 |
| Reacting volume ratios | 1volume |  | 3 volume |  | 2 volume 2 volume |

Balanced chemical equation: $\mathrm{C}_{\mathrm{x}} \mathrm{H}_{\mathbf{y}}(\mathrm{g})+3 \mathbf{3 O}_{2}(\mathrm{~g})$-> $\quad \mathbf{2} \mathbf{H}_{\mathbf{2}} \mathrm{O}(\mathrm{g})+2 \mathbf{C O}_{2}(\mathrm{~g})$ If " 4 H " are in $2 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$ the $\mathrm{y}=4$
If " 2 C " are in $2 \mathrm{CO}_{2}$ (g) the $\mathrm{x}=2$
Thus(i) chemical formula of hydrocarbon $=\mathbf{C}_{2} \mathbf{H}_{4}$
(ii) chemical name of hydrocarbon $=$ Ethene
4.100 cm 3 of nitrogen (II)oxide NO combine with 50 cm 3 of Oxygen to form 100 cm 3 of a single gaseous compound of nitrogen. All volumes measured at the same temperature and pressure. Obtain the equation for the reaction and name the gaseous product.

Chemical equation: $\quad \mathrm{NO}(\mathrm{g}) \quad+\quad \mathrm{O}_{2}(\mathrm{~g}) \quad->\quad \mathrm{NO}_{\mathrm{x}}$
Volumes 100 cm 3 : 50 cm 3 : 100
$\begin{aligned} & \text { Volume ratios } \\ & \text { (divide by lowest volume) }\end{aligned} \frac{100 \mathrm{~cm} 3}{\mathbf{5 0}} \quad: \quad \frac{50 \mathrm{~cm} 3}{\mathbf{5 0}}: \quad \frac{100}{\mathbf{5 0}} \mathrm{~cm} 3$
Reacting volume ratios 2 volume 1 volume 2 volume
Balanced chemical equation: $2 \mathrm{NO}(\mathrm{g})+\mathrm{O}_{2}(\mathrm{~g})$-> $2 \mathrm{NO}_{\mathbf{x}}(\mathrm{g})$
Thus(i) chemical formula of the nitrogen compound $=\underline{\mathbf{2}} \mathbf{N O}_{2}$
(ii) chemical name of compound $=\underline{\text { Nitrogen(IV)oxide }}$
5. When 15 cm 3 of a gaseous hydrocarbon was burnt in 100 cm 3 of Oxygen ,the resulting gaseous mixture occupied 70 cm 3 at room temperature and pressure.

When the gaseous mixture was passed through, potassium hydroxide its volume decreased to 25 cm 3 .
(a)What volume of Oxygen was used during the reaction.(1mk)

Volume of Oxygen used $=\mathbf{1 0 0}-\mathbf{2 5}$
$=\underline{75} \mathrm{~cm} 3 \sqrt{ }$ ( P was completely burnt)
(b)Determine the molecular formula of the hydrocarbon( 2 mk )
$\mathrm{C}_{\mathrm{x}} \mathrm{H}_{\mathrm{y}}+\mathrm{O}_{2}$-> $\mathrm{xCO}_{2}+\mathrm{yH}_{2} \mathrm{O}$ 15cm3: $\mathbf{7 5} \mathrm{cm} 3$
1515
$1: 3 \sqrt{ }$
=> 1 atom of C react with $6(3 \times 2)$ atoms of Oxygen
Thus $\mathbf{x}=1$ and $\mathrm{y}=2=>\mathbf{P}$ has molecula formula $\mathrm{CH}_{4} \sqrt{ }$

## (g) Ionic equations

An ionic equation is a chemical statement showing the movement of ions (cations and anions ) from reactants to products.
Solids, gases and liquids do not ionize/dissociate into free ions. Only ionic compounds in aqueous/solution or molten state ionize/dissociate into free cations and anions (ions)
An ionic equation is usually derived from a stoichiometric equation by using the following guidelines

Guidelines for writing ionic equations
1.Write the balanced stoichiometric equation
2.Indicate the state symbols of the reactants and products
3.Split into cations and anions all the reactants and products that exist in aqueous state.
4.Cancel out any cation and anion that appear on both the product and reactant side.
5. Rewrite the chemical equation. It is an ionic equation.

## Practice

(a)Precipitation of an insoluble salt

All insoluble salts are prepared in the laboratory from double decomposition /precipitation. This involves mixing two soluble salts to form one soluble and one insoluble salt

1. When silver nitrate( $(\mathrm{V})$ solution is added to sodium chloride solution,sodium nitrate $(\mathrm{V})$ solution and a white precipitate of silver chloride are formed.
$\underline{\text { Balanced stoichiometric equation }}$
$\mathrm{AgNO}_{3}(\mathrm{aq})+\mathrm{NaCl}(\mathrm{aq})->\mathrm{AgCl}(\mathbf{s}) \quad+\mathrm{NaNO}_{3}(\mathrm{aq})$
Split reactants product existing in aqueous state as cation/anion
$\mathrm{Ag}^{+}(\mathrm{aq})+\mathrm{NO}_{3}{ }^{-}(\mathrm{aq})+\mathrm{Na}^{+}(\mathrm{aq})+\mathrm{Cl}^{-}(\mathrm{aq}) \quad$-> $\mathrm{AgCl}(\mathbf{s})+\mathrm{Na}^{+}(\mathrm{aq})+\mathrm{NO}_{3}{ }^{-}(\mathrm{aq})$
Cancel out ions appearing on reactant and product side
$\mathrm{Ag}^{+}(\mathrm{aq})+\mathrm{N} \varnothing_{3}^{-}(\mathrm{aq})+\mathrm{X}^{+}(\mathrm{aq})+\mathrm{Cl}^{-}(\mathrm{aq}) \quad$-> $\mathrm{AgCl}(\mathbf{s})+\quad \mathrm{y}^{+}(\mathrm{aq})+\mathrm{N}_{3}{ }^{-}(\mathrm{aq})$
Rewrite the equation
$\mathrm{Ag}^{+}(\mathbf{a q})+\mathrm{Cl}^{-}(\mathbf{a q})->\quad \mathrm{AgCl}(\mathbf{s})$ (ionic equation)
2. When barium nitrate(V) solution is added to copper(II)sulphate(VI) solution, copper(II) nitrate(V) solution and a white precipitate of barium sulphate(VI) are formed.

Balanced stoichiometric equation
$\mathrm{Ba}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq})+\mathrm{CuSO}_{4}(\mathrm{aq}) \quad->\mathrm{BaSO}_{4}(\mathbf{s})+\mathrm{Cu}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq})$
Split reactants product existing in aqueous state as cation/anion
$\mathrm{Ba}^{2+}(\mathrm{aq})+\mathbf{2} \mathrm{NO}_{3}^{-}(\mathrm{aq})+\mathrm{Cu}^{2+}(\mathrm{aq})+\mathrm{SO}_{4}^{2-}(\mathrm{aq})->\mathrm{BaSO}_{4}(\mathbf{s})+\mathbf{2} \mathrm{NO}_{3}{ }^{-}(\mathrm{aq})+\mathrm{Cu}^{2+}(\mathrm{aq})$
Cancel out ions appearing on reactant and product side

Rewrite the equation
$\mathrm{Ba}^{2+}(\mathrm{aq})+\mathrm{SO}_{4}{ }^{2-( }(\mathrm{aq})->\mathrm{BaSO}_{4}(\mathrm{~s})$ (ionic equation)
3.A yellow precipitate of Potassium Iodide is formed from the reaction of Lead(II)nitrate(v) and potassium iodide.
Balanced stoichiometric equation
$\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq}) \quad+\quad 2 \mathrm{KI}(\mathrm{aq}) \quad->\mathrm{PbI}_{2}(\mathbf{s})+2 \mathrm{KNO}_{3}(\mathrm{aq})$

Split reactants product existing in aqueous state as cation/anion
$\mathrm{Pb}^{2+}(\mathrm{aq})+2 \mathrm{NO}_{3}^{-}(\mathrm{aq})+2 \mathrm{~K}^{+}(\mathrm{aq})+2 \mathrm{I}^{-}(\mathrm{aq})->\mathrm{PbI}_{2}(\mathbf{s})+2 \mathrm{NO}_{3}{ }^{-}(\mathrm{aq})+2 \mathrm{~K}^{+}(\mathrm{aq})$
Cancel out ions appearing on reactant and product side
$\mathrm{Pb}^{2+}(\mathrm{aq})+2 \mathrm{KO}_{3}^{-}(\mathrm{aq})+2 \mathrm{~K}^{+}(\mathrm{aq})+2 \mathrm{I}^{-}(\mathrm{aq})->\mathrm{PbI}_{2}(\mathrm{~s})+2 \mathrm{XO}_{3}^{-}(\mathrm{aq})+2 \mathrm{~K}^{+}(\mathrm{aq})$
Rewrite the equation
$\mathbf{P b}^{2+}(\mathbf{a q})+2 \mathrm{I}^{-}(\mathbf{a q})->\quad \mathrm{PbI}_{2}(\mathrm{~s})$ (ionic equation)
(b)Neutralization

Neutralization is the reaction of an acid with a soluble base/alkali or insoluble base.
(i)Reaction of alkalis with acids
1.Reaction of nitric(V)acid with potassium hydroxide

Balanced stoichiometric equation
$\mathrm{HNO}_{3}(\mathrm{aq})+\mathrm{KOH}(\mathrm{aq}) \quad->\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{KNO}_{3}(\mathrm{aq})$
Split reactants product existing in aqueous state as cation/anion
$\mathrm{H}^{+}(\mathrm{aq})+\mathrm{NO}_{3}^{-}(\mathrm{aq})+\mathrm{K}^{+}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq})->\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{NO}_{3}^{-}(\mathrm{aq})+\mathrm{K}^{+}(\mathrm{aq})$
Cancel out ions appearing on reactant and product side
$\mathrm{H}^{+}(\mathrm{aq})+\mathrm{DO}_{3}^{-}(\mathrm{aq})+\mathrm{K}^{+}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq})->\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{AO}_{3}^{-}(\mathrm{aq})+\mathrm{K}^{+}(\mathrm{aq})$
Rewrite the equation
$\mathrm{H}^{+}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq})->\mathrm{H}_{2} \mathrm{O}$ (l) (ionic equation)
2.Reaction of sulphuric(VI)acid with ammonia solution

Balanced stoichiometric equation
$\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})+\quad 2 \mathrm{NH}_{4} \mathrm{OH}(\mathrm{aq}) \quad->\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\quad\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}(\mathrm{aq})$

Split reactants product existing in aqueous state as cation/anion
$2 \mathrm{H}^{+}(\mathrm{aq})+\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})+2 \mathrm{NH}_{4}{ }^{+}(\mathrm{aq})+2 \mathrm{OH}^{-}(\mathrm{aq})->2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{SO}_{4}{ }^{2-} \quad(\mathrm{aq})+2 \mathrm{NH}_{4}{ }^{+}(\mathrm{aq})$
Cancel out ions appearing on reactant and product side
$2 \mathrm{H}^{+}(\mathrm{aq})+\mathrm{SC}_{4}^{2-}(\mathrm{aq})+2 \mathrm{NH}_{4}^{+}(\mathrm{aq})+2 \mathrm{OH}^{-}(\mathrm{aq})->2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{SO}^{--} \quad(\mathrm{aq})+2 \mathrm{NA}_{4}^{+}(\mathrm{aq})$

Rewrite the equation

| $\left.\overline{2 \mathrm{H}^{+}(\mathrm{aq})+2 \mathrm{OH}^{-}(\mathrm{aq}}\right)$ | -> | $\underline{2} \mathrm{H}_{2} \mathrm{O}$ (l) |
| :--- | :--- | :--- |
| $\mathrm{H}^{+}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq})$ | -> | $\mathbf{H}_{2} \mathrm{O}$ (l) (ionic equation) |

3.Reaction of hydrochloric acid with Zinc hydroxide

Balanced stoichiometric equation
$2 \mathrm{HCl}(\mathrm{aq})+\mathrm{Zn}(\mathrm{OH})_{2}(\mathbf{s})->2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{ZnCl}_{2}(\mathrm{aq})$
Split reactants product existing in aqueous state as cation/anion
$2 \mathrm{H}^{+}(\mathrm{aq})+2 \mathrm{Cl}^{-}(\mathrm{aq})+\mathrm{Zn}(\mathrm{OH})_{2}(\mathrm{~s})->2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+2 \mathrm{Cl}^{-}(\mathrm{aq})+\mathrm{Zn}^{2+}(\mathrm{aq})$
Cancel out ions appearing on reactant and product side
$2 \mathrm{H}^{+}(\mathrm{aq})+2 \mathrm{Cl}^{-}(\mathrm{aq})+\mathrm{Zn}(\mathrm{OH})_{2}(\mathrm{~s})->2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\not \mathrm{ZCl}^{-}(\mathrm{aq})+\mathrm{Zn}^{2+}(\mathrm{aq})$
Rewrite the equation
$2 \mathrm{H}^{+}(\mathrm{aq})+\mathrm{Zn}(\mathrm{OH})_{2}($ s $)->2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{Zn}^{2+}(\mathrm{aq})$ (ionic equation)
(h)Molar solutions

A molar solution is one whose concentration is known. The SI unit of concentration is Molarity denoted $\mathbf{M}$.
Molarity may be defined as the number of moles of solute present in one cubic decimeter of solution.
One cubic decimeter is equal to one litre and also equal to $\mathbf{1 0 0 0} \mathbf{c m} 3$.
The higher the molarity the higher the concentration and the higher/more solute has been dissolved in the solvent to make one cubic decimeter/ litre/1000 cm3 solution.

## Examples

2 M sodium hydroxide means 2 moles of sodium hydroxide solute is dissolved in enough water to make one cubic decimeter/ litre/ 1000 cm 3 uniform solution mixture of sodium hydroxide and water.
0.02 M sodium hydroxide means 0.02 moles of sodium hydroxide solute is dissolved in enough water to make one cubic decimeter/ litre/1000cm3 uniform solution mixture of sodium hydroxide and water.
" 2 M " is more concentrated than" 0.02 M ".

## Preparation of molar solution

Procedure
Weigh accurately 4.0 g of sodium hydroxide pellets into a 250 cm 3 volumetric flask.
Using a wash bottle add about 200 cm 3 of distilled water.
Stopper the flask.
Shake vigorously for three minutes.
Remove the stopper for a second then continue to shake for about another two minutes until all the solid has dissolved.
Add more water slowly upto exactly the 250 cm 3 mark.

## Sample questions

## 1.Calculate the number of moles of sodium hydroxide pellets present in:

(i) 4.0 g .

Molar mass of $\mathrm{NaOH}=(23+16+1)=40 \mathrm{~g}$
Moles $=\underline{\text { Mass }}$
Molar mass
$\Rightarrow \frac{4.0}{40}=\mathbf{0 . 1} / \mathbf{1 . 0} \mathbf{x 1 0} \mathbf{1 0}^{\mathbf{- 1}}$ moles
(ii) $\mathbf{2 5 0} \mathbf{~ c m} 3$ solution in the volumetric flask.

Moles in $250 \mathrm{~cm} 3=\mathbf{0 . 1} / \mathbf{1 . 0} \times \mathbf{1 0}^{\mathbf{- 1}}$ moles
(iii) one decimeter of solution

Method 1
Moles in decimeters $=$ Molarity $=\frac{\text { Moles x } 1000 \mathrm{~cm} 3 / 1 \mathrm{dm} 3}{\text { Volume of solution }}$
$\Rightarrow \underline{1.0 \times 10^{-1}} \underline{\text { moles } \times 1000 \mathrm{~cm} 3}=$

$$
=\underline{0.4 \mathrm{M} / 0.4 \text { molesdm }^{-3}}
$$

Method 2
250 cm 3 solution contain $1.0 \times 10^{-1}$ moles
1000 cm 3 solution $=$ Molarity contain $\frac{1000 \times 1.0 \times 10}{250 \mathrm{~cm} 3}-\frac{-1}{}$ moles

$$
=\underline{0.4 \mathrm{M} / 0.4 \mathrm{molesdm}^{-3}}
$$

Theoretical sample practice

1. Calculate the molarity of a solution containing:

## (i) 4.0 g sodium hydroxide dissolved in 500 cm 3 solution

$$
\text { Molar mass of } \mathrm{NaOH}=(23+16+1)=40 \mathrm{~g}
$$

$$
\underset{\text { Moles }=\underset{\text { Mass }}{\text { Mass }}}{\text { Molar }} \quad=>\frac{4.0}{40}=\mathbf{0 . 1} / \mathbf{1 . 0} \times \mathbf{1 0}^{\mathbf{- 1}} \text { moles }
$$

Method 1

$$
\begin{aligned}
\text { Moles in decimeters }= & \text { Molarity }=\frac{\text { Moles } \times 1000 \mathrm{~cm} 3 / 1 \mathrm{dm} 3}{\text { Volume of solution }} \\
& =>\underline{1.0 \times 10^{-1}} \underline{\text { moles } \times 1000 \mathrm{~cm} 3} \\
& =\underline{\mathbf{0 . 2} \mathbf{M} / \mathbf{0 . 2} \text { molesdm }{ }^{-3}}
\end{aligned}
$$

Method 2
500 cm 3 solution contain $1.0 \times 10^{-1}$ moles
1000 cm 3 solution $=$ Molarity contain $\frac{1000 \times 1.0 \times 10}{500 \mathrm{~cm} 3}-\frac{-1}{}$ moles

$$
=0.2 \mathrm{M} / 0.2 \text { molesdm }^{-3}
$$

(ii) 5.3 g anhydrous sodium carbonate dissolved in 50 cm 3 solution

Molar mass of $\mathrm{Na}_{2} \mathrm{CO}_{3}=(23 \times 2+12+16 \times 3)=106 \mathrm{~g}$

$$
\text { Moles } \underset{\text { Molar mass }}{=\text { Mass }} \quad \Rightarrow \frac{5.3}{106}=\mathbf{0 . 0 5 / 5 . 0 \times 1 0 ^ { - 2 }} \text { moles }
$$

Method 1

$$
\begin{aligned}
\text { Moles in decimeters }= & \text { Molarity }=\frac{\text { Moles } x 1000 \mathrm{~cm} 3 / 1 \mathrm{dm} 3}{\text { Volume of solution }} \\
& =>\frac{1.0 \text { moles } \times 1000 \mathrm{~cm} 3}{50 \mathrm{~cm} 3}= \\
& =\underline{\mathbf{1 . 0} \mathbf{M}}
\end{aligned}
$$

Method 2
50 cm 3 solution contain $5.0 \times 10^{-2}$ moles

$$
1000 \mathrm{~cm} 3 \text { solution }=\text { Molarity contain } \frac{1000 \times 5.0 \times 10}{50 \mathrm{~cm} 3} \stackrel{-2}{ } \underline{\text { moles }}
$$

$$
=\underline{1.0 \mathrm{M} / 1.0 \text { molesdm }^{-3}}
$$

(iii) 5.3 g hydrated sodium carbonate decahydrate dissolved in 50 cm 3 solution

Molar mass of $\mathrm{Na}_{2} \mathrm{CO}_{3} .10 \mathrm{H}_{2} \mathrm{O}=(23 \times 2+12+16 \times 3+20 \times 1+10 \times 16)=286 \mathrm{~g}$

$$
\text { Moles }=\frac{\text { Mass }}{\text { Molar mass }} \quad \Rightarrow \frac{5.3}{286} \quad=\mathbf{0 . 0 1 8 5} / \mathbf{1 . 8 5} \times 10^{\mathbf{- 2}} \text { moles }
$$

Method 1

$$
\begin{aligned}
\text { Moles in decimeters } & =\text { Molarity }=\underline{\text { Moles } \times 1000 \mathrm{~cm} 3 / 1 \mathrm{dm} 3} \\
& =>\underline{1.85 \times 10^{-2}} \underline{\underline{-2}} \underline{\underline{\text { moles } \times 1000 \mathrm{~cm} 3}}= \\
& =\underline{\mathbf{0 . 3 7} \mathbf{~ M} / \mathbf{0} .37 \text { molesdm }^{-3}}
\end{aligned}
$$

Method 2
50 cm 3 solution contain $1.85 \times 10^{-2}$ moles

$$
\begin{aligned}
\text { 1000 } \mathrm{cm} 3 \text { solution } & =\text { Molarity contain } \frac{1000 \times 1.85 \times 10}{50 \mathrm{~cm} 3} \\
& =\underline{\mathbf{3 . 7} \times 10^{-1} \mathbf{M} / \mathbf{3 . 7} \times 10^{-1} \text { molesdm }^{-\mathbf{3}}}
\end{aligned}
$$

(iv) 7.1 g of anhydrous sodium sulphate(VI)was dissolved in 20.0 cm 3 solution. Calculate the molarity of the solution.
Method 1

$$
\begin{aligned}
& 20.0 \mathrm{~cm} 3 \text { solution ->7.1 g } \\
& 1000 \mathrm{~cm} 3 \text { solution -> } \frac{1000 \times 71}{20}=\underline{3550 \mathrm{~g} \mathrm{dm}^{-3}}
\end{aligned}
$$

Molar mass $\mathrm{Na}_{2} \mathrm{SO}_{4}=142 \mathrm{~g}$
Moles $\mathbf{d m}^{\mathbf{- 3}}=$ Molarity $=\frac{\text { Mass }}{\text { Molar mass }} \frac{3550}{142}=\underline{2.5 \mathrm{M} / \text { molesdm }^{\mathbf{- 3}}}$
Method 2

$$
\begin{aligned}
& \text { Molar mass } \mathrm{Na}_{2} \mathrm{SO}_{4} \\
& \text { Moles = }=142 \mathrm{~g} \\
& \underset{\text { Molar mass }}{\text { Mola }}
\end{aligned}=>\frac{7.1}{142} \quad=\mathbf{0 . 0 5 / 5 . 0 \times 1 0 ^ { - 2 }} \text { moles }
$$

Method 2(a)
Moles in decimeters $=$ Molarity $=\frac{\text { Moles x } 1000 \mathrm{~cm} 3 / 1 \mathrm{dm} 3}{\text { Volume of solution }}$

$$
\begin{gathered}
\Rightarrow 5.0 \times 10-2 \text { moles } \times 1000 \mathrm{~cm} 3 \\
20 \mathrm{~cm} 3
\end{gathered}
$$

$=\underline{2.5 \mathrm{M} / 2.5 \text { molesdm }^{-3}}$

Method 2(b)
20 cm 3 solution contain $5.0 \times 10^{-2}$ moles
1000 cm 3 solution $=$ Molarity contain $\frac{1000 \times 5.0 \times 10^{-2}}{20 \mathrm{~cm} 3} \underline{\text { moles }}$
$=\underline{\mathbf{2 . 5} \mathrm{M} / 2.5 \text { molesdm }^{-3}}$
(iv) The density of sulphuric(VI) is $1.84 \mathrm{gcm}^{-3}$ Calculate the molarity of the acid.
Method 1
1.0 cm 3 solution $->1.84 \mathrm{~g}$

1000 cm 3 solution -> $\frac{1000 \times 1.84}{1}=1840 \mathrm{~g} \mathrm{dm}^{-3}$
Molar mass $\mathrm{H}_{2} \mathrm{SO}_{4}=98 \mathrm{~g}$

$$
\begin{aligned}
\text { Moles } \mathbf{d m}^{\mathbf{- 3}} & =\text { Molarity }=\underline{\text { Mass }} \underset{\text { Molar mass }}{98} \\
& =\underline{\mathbf{1 8 . 7 7 5 5} \mathbf{~ M} / \text { moles } \mathbf{d m}^{\mathbf{- 3}}}
\end{aligned}
$$

Method 2
Molar mass $\mathrm{H}_{2} \mathrm{SO}_{4}=98 \mathrm{~g}$

$$
\text { Moles }=\frac{\text { Mass }}{\text { Molar mass }} \quad \Rightarrow \frac{1.84}{98} \quad=\mathbf{0 . 0 1 8 8} / \mathbf{1 . 8 8} \times \mathbf{1 0}^{\mathbf{- 2}} \text { moles }
$$

Method 2(a)
Moles in decimeters $=\mathbf{M o l a r i t y}=\underline{\text { Moles x } 1000 \mathrm{~cm} 3 / 1 d m 3}$

$$
\begin{aligned}
& \text { Volume of solution } \\
& \Rightarrow 1.88 \times 10^{-2} \quad \underline{\text { moles } \times 1000 \mathrm{~cm} 3} \\
& 1.0 \mathrm{~cm} 3
\end{aligned}
$$

$=\underline{18.8 \mathrm{M} / 18.8 \text { molesdm }^{-3}}$
Method 2(b)
20 cm 3 solution contain $1.88 \times 10^{-2}$ moles
1000 cm 3 solution $=$ Molarity contain $\underline{1000 \times 1.88 \times 10^{-2}} \underline{\underline{\text { moles }}}$ 1.0 cm 3

$$
=\underline{18.8 \mathrm{M} / 18.8 \mathrm{molesdm}^{-3}}
$$

## 2. Calculate the mass of :

(i) $\mathbf{2 5} \mathbf{~ c m} 3$ of $\mathbf{0 . 2 M}$ sodium hydroxide solution( $\mathrm{Na}=\mathbf{2 3 . 0} . \mathrm{O}=16.0, \mathrm{H}=1.0$ )

Molar mass $\mathrm{NaOH}=\underline{\mathbf{4 0}} \mathbf{g}$

Moles in $25 \mathrm{~cm} 3=\frac{\text { Molarity x volume }}{1000} \quad=\frac{0.2 \times 25}{1000}=\underline{\mathbf{0 . 0 0 5} / \mathbf{5 . 0} \mathbf{x 1 0}} \mathbf{}$ moles
Mass of $\mathrm{NaOH}=$ Moles $\times$ molar mass $=5.0 \times 10^{-3} \times 40=\underline{\mathbf{0 . 2} \mathbf{g}}$
(ii) 20 cm 3 of $\mathbf{0 . 6 2 5} \mathrm{M}$ sulphuric(VI)acid ( $\mathrm{S}=\mathbf{3 2 . 0 . 0}=\mathbf{1 6 . 0}, \mathrm{H}=\mathbf{1 . 0}$ )

Molar mass $\mathrm{H}_{2} \mathrm{SO}_{4}=\underline{\mathbf{9 8} g}$
Moles in $20 \mathrm{~cm} 3=\underline{\text { Molarity } \mathrm{x} \text { volume }=>} \frac{0.625 \times 20}{1000}=\underline{\mathbf{0 . 0 1 2 5} / \mathbf{1 . 2 5 . 0} \times 10^{-\mathbf{3}}} \mathrm{moles}$
Mass of $\mathrm{H}_{2} \mathrm{SO}_{4}=$ Moles $x$ molar mass $=>5.0 \times 10^{-3} \times 40=\underline{\mathbf{0 . 2} \mathbf{g}}$
(iii) 1.0 cm 3 of $\mathbf{2 . 5} \mathrm{M}$ Nitric( V )acid ( $\mathrm{N}=\mathbf{1 4 . 0 . 0}=\mathbf{1 6 . 0}, \mathrm{H}=\mathbf{1 . 0}$ )

Molar mass $\mathrm{HNO}_{3}=\underline{\mathbf{6 3} \mathbf{g}}$
Moles in $1 \mathrm{~cm} 3=\frac{\text { Molarity } x \text { volume }}{1000}=>\frac{2.5 \times 1}{1000}=\underline{\mathbf{0 . 0 0 2 5} / \mathbf{2 . 5} \times \mathbf{x 1 0} \mathbf{- 3}}$ moles
Mass of $\mathrm{HNO}_{3}=$ Moles $x$ molar mass $=>2.5 \times 10^{-3} \times 40=\underline{\mathbf{0 . 1} \mathbf{g}}$
3. Calculate the volume required to dissolve :
(a)(i) 0.25 moles of sodium hydroxide solution to form a 0.8 M solution

Volume $($ in cm3 $)=\frac{\text { moles x } 1000}{\text { Molarity }} \Rightarrow \frac{0.25 \times 1000}{0.8}=\underline{\mathbf{3 1 2 . 5} \mathbf{c m} 3}$
(ii) 100 cm 3 was added to the sodium hydroxide solution above. Calculate the concentration of the solution.
$\mathrm{C}_{1} \times \mathrm{V}_{1}=\mathrm{C}_{2} \times \mathrm{V}_{2}$ where:
$\mathrm{C}_{1}=$ molarity/concentration before diluting/adding water
$\mathrm{C}_{2}=$ molarity/concentration after diluting/adding water
$\mathrm{V}_{1}=$ volume before diluting/adding water
$\mathrm{V}_{2}=$ volume after diluting/adding water
$\Rightarrow 0.8 \mathrm{M} \times 312.5 \mathrm{~cm} 3=\mathrm{C}_{2} \times(312.5+100)$
$\mathrm{C}_{2}=\underline{0.8 \mathrm{M} \times 312.5 \mathrm{~cm} 3}=\mathbf{0 . 6 0 6 1} \mathrm{M}$
412.5
(b)(ii) 0.01 M solution containing 0.01 moles of sodium hydroxide solution . Volume (in cm3) $=\frac{\text { moles x } 1000}{\text { Molarity }}=\frac{0.01 \times 1000}{0.01}=\underline{\mathbf{1 0 0 0} \mathbf{~ c m 3}}$
(ii) Determine the quantity of water which must be added to the sodium hydroxide solution above to form a 0.008 M solution.
$\mathrm{C}_{1} \times \mathrm{V}_{1}=\mathrm{C}_{2} \times \mathrm{V}_{2}$ where:
$\mathrm{C}_{1}=$ molarity/concentration before diluting/adding water
$\mathrm{C}_{2}=$ molarity/concentration after diluting/adding water
$\mathrm{V}_{1}=$ volume before diluting/adding water
$\mathrm{V}_{2}=$ volume after diluting/adding water
$\Rightarrow 0.01 \mathrm{M} \times 1000 \mathrm{~cm} 3=0.008 \times \mathrm{V}_{2}$

$$
\begin{aligned}
& \mathrm{V}_{2}=\frac{0.01 \mathrm{M} \times 1000 \mathrm{~cm} 3}{0.008}=\mathbf{1 2 5 0} \mathbf{c m} 3 \\
& \quad \text { Volume added }=1250-1000=\mathbf{2 5 0} \mathbf{c m 3}
\end{aligned}
$$

## (c)Volumetric analysis/Titration

Volumetric analysis/Titration is the process of determining unknown concentration of one reactant from a known concentration and volume of another. Reactions take place in simple mole ratio of reactants and products.
Knowing the concentration/ volume of one reactant, the other can be determined from the relationship:
$\frac{\mathbf{M}_{1} \mathbf{V}_{\mathbf{1}}}{\tilde{\mathbf{n}}_{1}}=\frac{\mathbf{M}_{2} \mathbf{V}_{2}}{\tilde{\mathbf{n}}_{2}}$ where:
$\mathrm{M}_{1}=$ Molarity of $1^{\text {st }}$ reactant
$\mathrm{M}_{2}=$ Molarity of $2^{\text {nd }}$ reactant
$\mathrm{V}_{1}=$ Volume of $1^{\text {st }}$ reactant
$\mathrm{v}_{1}=$ Volume of $2^{\text {nd }}$ reactant
$\mathrm{n}_{1}=$ number of moles of $1^{\text {st }}$ reactant from stoichiometric equation
$\mathrm{n}_{2}=$ number of moles of $2^{\text {nd }}$ reactant from stoichiometric equation Examples

1. Calculate the molarity of $\mathrm{MCO}_{3}$ if 5.0 cm 3 of $\mathrm{MCO}_{3}$ react with 25.0 cm 3 of 0.5 M hydrochloric acid.( $\mathrm{C}=\mathbf{1 2 . 0}, \mathrm{O}=16.0$ )

Stoichiometric equation: $\mathrm{MCO}_{3}(\mathrm{~s})+2 \mathrm{HCl}(\mathrm{aq})->\mathrm{MCl}_{2}(\mathrm{aq})+\mathrm{CO}_{2}(\mathrm{~g})+$ $\mathrm{H}_{2} \mathrm{O}(1)$ Method 1

$$
\begin{aligned}
& \underline{\mathrm{M}}_{1}-\underline{V}_{1} \\
& \mathrm{n}_{1}=\underline{\mathrm{M}}_{2}-\frac{\mathrm{V}}{\mathrm{n}_{2}} \quad 2^{->} \quad \underline{\mathrm{M}_{1}} \times \frac{5.0 \mathrm{~cm} 3}{1}=\frac{0.5 \mathrm{M} \times 25.0 \mathrm{~cm} 3}{2} \\
& \Rightarrow \mathrm{M}_{1}=\quad \frac{0.5 \times 25.0 \times 1}{5.0 \times 2}=\underline{\mathbf{1 . 2 5 M}} / \mathbf{1 . 2 5} \mathbf{m o l e d m}^{-\mathbf{3}}
\end{aligned}
$$

Method 2
Moles of HCl used $=\underline{\text { molarity } \mathrm{x} \text { volume }}$

$$
\begin{gathered}
1000 \\
\Rightarrow \quad \underline{0.5} \frac{\times 25.0}{1000}=\underline{\mathbf{0 . 0 1 2 5 / 1 . 2 5 \times 1 0 ^ { - 2 }} \mathrm{moles}}
\end{gathered}
$$

Mole ratio $\mathrm{MCO}_{3}: \mathrm{HCl}=1: 2$
Moles $\mathrm{MCO}_{3}=\frac{0.0125 / 1.25 \times 10^{-2} \mathrm{moles}}{2}=\underline{\mathbf{0 . 0 0 6 2 5} / 6.25 \times 10^{-3} \mathrm{moles}}$
Molarity $\mathrm{MCO}_{3}=\frac{\text { moles x } 1000}{\text { Volume }} \Rightarrow \frac{0.00625 / 6.25 \times 10^{-3} \times 1000}{5}$

$$
=\underline{1.25 \mathrm{M}} / \underline{1.25 \mathrm{moledm}^{-3}}
$$

## 2. 2.0 cm 3 of 0.5 M hydrochloric acid react with 0.1 M of $\mathrm{M}_{2} \mathrm{CO}_{3}$. Calculate

 the volume of $0.1 \mathrm{M} \mathrm{M}_{2} \mathrm{CO}_{3}$ used.Stoichiometric equation: $\mathrm{M}_{2} \mathrm{CO}_{3}(\mathrm{aq})+2 \mathrm{HCl}(\mathrm{aq})->2 \mathrm{MCl}(\mathrm{aq})+\mathrm{CO}_{2}(\mathrm{~g})+$ $\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ Method 1

$$
\begin{aligned}
& \frac{\mathrm{M}_{1}}{-} \underline{\mathrm{V}}_{1}=\underline{\mathrm{M}}_{2}-\underline{V}_{2} \\
& \mathrm{n}_{2} \\
& \\
&=>\mathrm{V}_{2}=\frac{0.5 \times 2.0 \mathrm{~cm} 3}{2}=\frac{0.1 \mathrm{M} \times \mathrm{V}}{1}-\frac{0.5 \times 2.0 \times 1=\mathbf{1 . 2 5 M}}{0.1 \times 2} 1.25 \text { moledm }^{-3}
\end{aligned}
$$

Method 2
Moles of HCl used $=\frac{\text { molarity } \mathrm{x} \text { volume }}{1000}$

$$
\Rightarrow \frac{0.5 \times 2.0}{1000}=\underline{\mathbf{0 . 0 1 2 5} / 1.25 \times 10^{-2} \text { moles }}
$$

Mole ratio $\mathrm{M}_{2} \mathrm{CO}_{3}: \mathrm{HCl}=1: 2$
Moles $\mathrm{M}_{2} \mathrm{CO}_{3}=\frac{0.0125 / 1.25 \times 10^{-2} \mathrm{moles}}{2}=\underline{\mathbf{0 . 0 0 6 2 5} / 6.25 \times 10^{-3} \mathrm{moles}}$
Molarity $\mathrm{M}_{2} \mathrm{CO}_{3}=\frac{\text { moles x } 1000}{\text { Volume }} \Rightarrow \frac{0.00625 / 6.25 \times 10^{-3} \times 1000}{5}$

## $=\underline{1.25 \mathrm{M}} / \underline{1.25 \text { moledm }^{-3}}$

3. 5.0 cm 3 of 0.1 M sodium iodide react with 0.1 M of Lead(II)nitrate(V). Calculate(i) the volume of Lead(II)nitrate(V) used.
(ii)the mass of Lead(II)Iodide formed
( $\mathrm{Pb}=207.0, \mathrm{I}=127.0$ )
Stoichiometric equation: $2 \mathrm{NaI}(\mathrm{aq})+\mathrm{Pb}\left(\mathrm{NO}_{3}\right) 2(\mathrm{aq})->2 \mathrm{NaNO}_{3}(\mathrm{aq})+\mathrm{PbI}_{2}(\mathbf{s})$
(i) Volume of Lead(II)nitrate(V) used

Method 1

$$
\begin{aligned}
& \underline{\mathrm{M}}_{1}-\underline{V}_{1}=\frac{\underline{\mathrm{M}}_{2}}{\mathrm{n}_{1}} \underline{\mathrm{~V}}_{2} \quad \rightarrow \quad \frac{5 \times 0.1 \mathrm{~cm} 3}{2}=\frac{0.1 \mathrm{M} \mathrm{x} \mathrm{~V}}{1}-2 \underline{c m 3} \\
& \Rightarrow>\mathrm{V}_{2}=\frac{0.1 \times 5.0 \times 1}{0.1 \times 2}=\underline{\mathbf{1 . 2 5 M}} / \underline{\mathbf{1 . 2 5} \mathrm{moledm}^{-\mathbf{3}}}
\end{aligned}
$$

Method 2
$\overline{\text { Moles of }} \mathrm{HCl}$ used $=\frac{\text { molarity } \mathrm{x} \text { volume }}{1000}$

$$
\Rightarrow \frac{0.1 \mathrm{x} \quad 5.0}{1000}=\underline{\underline{0.0125} / 1.25 \times 10^{-2} \mathrm{moles}}
$$

Mole ratio $\mathrm{M}_{2} \mathrm{CO}_{3}: \mathrm{HCl}=1: 2$
Moles $\mathrm{M}_{2} \mathrm{CO}_{3}=\frac{0.0125 / 1.25 \times 10^{-2} \text { moles }}{2}=\underline{\mathbf{0 . 0 0 6 2 5} / \mathbf{6 . 2 5} \times 10^{-3} \mathrm{moles}}$
Molarity $\mathrm{M}_{2} \mathrm{CO}_{3}=\frac{\text { moles x } 1000}{\text { Volume }} \Rightarrow \frac{0.00625 / 6.25 \times 10^{-3} \times 1000}{5}$

$$
=\underline{1.25 \mathrm{M}} / \underline{1.25} \mathrm{moledm}^{-3}
$$

4. 0.388 g of a monobasic organic acid $B$ required 46.5 cm 3 of 0.095 M sodium hydroxide for complete neutralization. Name and draw the structural formula of $B$
Moles of NaOH used $=\underline{\text { molarity } \mathrm{x} \text { volume }}$ 1000

$$
\Rightarrow \frac{0.095}{1000} \frac{46.5}{}=\underline{\mathbf{0 . 0 0 4 4 1 7 5 / 4 . 4 1 7 5 \times 1 0 ^ { - 3 } \text { moles }}}
$$

Mole ratio B : $\mathrm{NaOH}=1: 1$

Moles $B=\underline{0.0044175 / 4.4175 \times 10^{-3} \text { moles }}$

Molar mass B $\quad=\underline{\text { mass }} \underset{\text { moles }}{ } \quad \Rightarrow \quad \underline{0.388}$

$$
=\underline{87.8324} \text { gmole }^{-1}
$$

$\mathrm{X}-\mathrm{COOH}=87.8324$ where X is an alkyl
group $X=87.8324-42=42.8324=43$
By elimination: $\mathrm{CH}_{3}=15 \quad \mathrm{CH}_{3} \mathrm{CH}_{2}=29 \quad \mathbf{C H}_{3} \mathbf{C H}_{2} \mathbf{C H}_{2}=\mathbf{4 3}$
Molecula formula : $\mathbf{C H}_{3} \mathbf{C H}_{\mathbf{2}} \mathbf{C H}_{\mathbf{2}} \mathbf{C O O H}$
Molecule name : Butan-1-oic acid
Molecular structure

5. 10.5 g of an impure sample containing ammonium sulphate (VI) fertilizer was warmed with 250 cm 3 of 0.8 M sodium hydroxide solution. The excess of the alkali was neutralized by 85 cm 3 of 0.5 M hydrochloric acid. Calculate the \% of impurities in the ammonium sulphate (VI)fertilizer.
( $\mathrm{N}=14.0, \mathrm{~S}=\mathbf{3 2 . 0 , O}=16.0, \mathrm{H}=1.0$ )
Equation for neutralization
$\mathrm{NaOH}(\mathrm{aq})+\mathrm{HCl}(\mathrm{aq}) \quad->\quad \mathrm{NaOH}(\mathrm{aq})+\quad \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
Mole ratio $\mathrm{NaOH}(\mathrm{aq}): \mathrm{HCl}(\mathrm{aq})=1: 1$
Moles of $\mathrm{HCl}=\frac{\text { Molarity } \mathrm{x} \text { volume }}{1000} \Rightarrow \frac{0.5 \times 85}{1000}=\underline{\mathbf{0 . 0 4 2 5}}$ moles
Excess moles of $\mathrm{NaOH}(\mathrm{aq})=\mathbf{0 . 0 4 2 5}$ moles
Equation for reaction with ammonium salt
$2 \mathrm{NaOH}(\mathrm{aq})+\quad\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}(\mathrm{aq}) \quad \quad->\mathrm{Na}_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{NH}_{3}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
Mole ratio $\mathrm{NaOH}(\mathrm{aq}):\left(\mathrm{NH}_{4}\right) 2 \mathrm{SO}_{4}(\mathrm{aq})=2: 1$
Total moles of $\mathrm{NaOH}=\frac{\text { Molarity x volume }}{1000} \Rightarrow \frac{0.8 \times 250}{1000}=\underline{\mathbf{0 . 2} \text { moles }}$
Moles of NaOH that reacted with $\left(\mathrm{NH}_{4}\right){ }_{2} \mathrm{SO}_{4}=0.2-0.0425=\underline{\mathbf{0 . 1 5 7 5 m o l e s}}$
Moles $\left(\mathrm{NH}_{4}\right){ }_{2} \mathrm{SO}_{4}=1 / 2 \times 0.1575$ moles $=\mathbf{0 . 0 7 8 7 5 m o l e s}$
Molar mass $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}=\underline{\mathbf{1 3 2} \text { gmole }^{-\mathbf{1}}}$

Mass of in impure sample $=$ moles $\times$ molar mass $=>0.07875 \times 132=\mathbf{1 0 . 3 9 5} \mathbf{g}$ Mass of impurities $=10.5-10.395=\mathbf{0 . 1 0 5} \mathbf{g}$ $\%$ impurities $\quad=\frac{0.105 \times 100}{10.5}=\underline{\mathbf{1 . 0} \%}$

Practically volumetric analysis involves titration.
Titration generally involves filling a burette with known/unknown concentration of a solution then adding the solution to unknown/known concentration of another solution in a conical flask until there is complete reaction. If the solutions used are both colourless, an indicator is added to the conical flask. When the reaction is over, a slight/little excess of burette contents change the colour of the indicator. This is called the end point.
Set up of titration apparatus

Set up of Titration apparatus

The titration process involve involves determination of titre. The titre is the volume of burette contents/reading before and after the end point. Burette contents/reading before titration is usually called the Initial burette reading. Burette contents/reading after titration is usually called the Final burette reading. The titre value is thus a sum of the Final less Initial burette readings.
To reduce errors, titration process should be repeated at least once more. The results of titration are recorded in a titration table as below

Sample titration table

| Titration number | 1 | 2 | 3 |
| :--- | :---: | :---: | :---: |
| Final burette reading (cm3) | 20.0 | 20.0 | 20.0 |
| Initial burette reading $(\mathrm{cm} 3)$ | 0.0 | 0.0 | 0.0 |
| Volume of solution used $(\mathrm{cm} 3)$ | 20.0 | 20.0 | 20.0 |

As evidence of a titration actually done examining body requires the candidate to record their burette readings before and after the titration.
For KCSE candidates burette readings must be recorded in a titration table in the format provided by the Kenya National Examination Council.
As evidence of all titration actually done Kenya National Examination Council require the candidate to record their burette readings before and after the titration to complete the titration table in the format provided.

Calculate the average volume of solution used

$$
\frac{24.0+24.0+24.0}{3}=\mathbf{2 4 . 0} \mathbf{~ c m} 3
$$

As evidence of understanding the degree of accuracy of burettes, all readings must be recorded to a decimal point.
As evidence of accuracy in carrying the out the titration, candidates value should be within 0.2 of the school value .
The school value is the teachers readings presented to the examining body/council based on the concentrations of the solutions s/he presented to her/his candidates. Bonus mark is awarded for averaged reading within 0.1 school value as Final answer.

Calculations involved after the titration require candidates thorough practical and theoretical practice mastery on the:
(i)relationship among the mole, molar mass, mole ratios, concentration, molarity. (ii) mathematical application of $1^{\text {st }}$ principles.

Very useful information which candidates forget appears usually in the beginning of the question paper as:

## "You are provided with..."

All calculation must be to the $4^{\text {th }}$ decimal point unless they divide fully to a lesser decimal point.
Candidates are expected to use a non programmable scientific calculator.

## (a)Sample Titration Practice 1 (Simple Titration)

## You are provided with:

0.1 M sodium hydroxide solution A

Hydrochloric acid solution B
You are required to determine the concentration of solution B in moles per litre.
Procedure
Fill the burette with solution B. Pipette 25.0 cm 3 of solution A into a conical flask. Titrate solution A with solution B using phenolphthalein indicator to complete the titration table 1

Sample results Titration table 1

| Titration number | 1 | 2 | 3 |
| :--- | :---: | :---: | :---: |
| Final burette reading $(\mathrm{cm} 3)$ | $\mathbf{2 0 . 0}$ | $\mathbf{2 0 . 0}$ | $\mathbf{2 0 . 0}$ |
| Initial burette reading $(\mathrm{cm} 3)$ | $\mathbf{0 . 0}$ | $\mathbf{0 . 0}$ | $\mathbf{0 . 0}$ |
| Volume of solution B used $(\mathrm{cm} 3)$ | $\mathbf{2 0 . 0}$ | $\mathbf{2 0 . 0}$ | $\mathbf{2 0 . 0}$ |

Sample worked questions

## 1. Calculate the average volume of solution $B$ used

Average titre $=\frac{\text { Titre } 1+\text { Titre } 2+\text { Titre } 3}{3}=>\left(\frac{20.0+20.0+20.0}{3}\right)=\underline{\mathbf{2 0 . 0} \mathbf{c m} 3}$
2. How many moles of:
(i)solution A were present in 25 cm 3 solution.

Moles of solution $\mathrm{A}=\frac{\text { Molarity } \mathrm{x} \text { volume }}{1000}=\frac{0.1 \times 25}{1000}=\underline{2.5 \times 10^{-3}} \mathrm{moles}$
(ii)solution $B$ were present in the average volume.

Chemical equation: $\mathrm{NaOH}(\mathrm{aq})+\mathrm{HCl}(\mathrm{aq})->\mathrm{NaCl}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
Mole ratio $1: 1 \Rightarrow$ Moles of $A=$ Moles of $B=\underline{\mathbf{2 . 5} \times 10^{-3}}$ moles
(iii) solution $B$ in moles per litre.

Moles of B per litre $=\frac{\text { moles } \times 1000}{\text { Volume }}=\frac{2.5 \times 10^{-3} \times 1000}{20}=0.1 \mathrm{M}$

## (b)Sample Titration Practice 2 (Redox Titration)

## You are provided with:

Acidified Potassium manganate(VII) solution
A 0.1 M of an iron (II) salt solution B
8.5 g of ammonium iron(II)sulphate(VI) crystals $\left(\mathrm{NH}_{4}\right)_{2}$
$\mathrm{SO}_{4} \mathrm{FeSO}_{4} \cdot \mathrm{xH}_{2} \mathrm{O}$ solid C
You are required to
(i)standardize acidified potassium manganate(VII)
(ii)determine the value of $x$ in the formula $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4} \mathrm{FeSO}_{4} \cdot \mathrm{xH}_{2} \mathrm{O}$.

## Procedure 1

Fill the burette with solution A. Pipette 25.0 cm 3 of solution B into a conical flask.
Titrate solution A with solution B until a pink colour just appears.
Record your results to complete table 1.
Table 1:Sample results

| Titration number | 1 | 2 | 3 |
| :--- | :---: | :---: | :---: |
| Final burette reading $(\mathrm{cm} 3)$ | $\mathbf{2 0 . 0}$ | 20.0 | 20.0 |
| Initial burette reading $(\mathrm{cm} 3)$ | $\mathbf{0 . 0}$ | $\mathbf{0 . 0}$ | 0.0 |
| Volume of solution A used $(\mathrm{cm} 3)$ | $\mathbf{2 0 . 0}$ | $\mathbf{2 0 . 0}$ | $\mathbf{2 0 . 0}$ |

Sample worked questions

1. Calculate the average volume of solution $A$ used

Average titre $=\frac{\text { Titre } 1+\text { Titre } 2+\text { Titre } 3}{3} \Rightarrow>\left(\frac{20.0+20.0+20.0}{3}\right)=\underline{\mathbf{2 0} \underline{0 \mathbf{c m} 3}}$

## 2. How many moles of:

(i)solution $B$ were present in 25 cm 3 solution.

Moles of solution $\mathrm{A}=\frac{\text { Molarity x volume }}{1000}=\frac{0.1 \times 25}{1000}=\underline{2.5 \times 10^{-3}} \mathrm{moles}$
(ii)solution A were present in the average volume. Assume one mole of $B$ react with five moles of $B$

> Mole ratio A : B $=1: 5$
> $\Rightarrow$ Moles of $\mathrm{A}=\frac{\text { Moles of } \mathrm{B}=}{5} \quad \frac{2.5 \times 10^{-3}}{5}$ moles $=5.0 \times 10^{-4}$ moles
(iii) solution $B$ in moles per litre.

$$
\begin{aligned}
\text { Moles of B per litre } & =\frac{\text { moles x } 1000}{\text { Volume }}=\frac{2.5 \times 10^{-3} \times 1000}{20} \\
& =\mathbf{0 . 0 2 5 ~ M} / \text { moles per litre } / \mathrm{moles} \mathrm{l}^{-1}
\end{aligned}
$$

## Procedure 2

Place all the solid C into the 250 cm 3 volumetric flask carefully. Add about 200 cm 3 of distilled water. Shake to dissolve. Make up to the 250 cm 3 of solution by adding more distilled water. Label this solution C. Pipette 25 cm 3 of solution C into a conical flask, Titrate solution C with solution A until a permanent pink colour just appears. Complete table 2.

Table 2:Sample results

| Titration number | 1 | 2 | 3 |
| :--- | :---: | :---: | :---: |
| Final burette reading (cm3) | $\mathbf{2 0 . 0}$ | 20.0 | 20.0 |
| Initial burette reading (cm3) | $\mathbf{0 . 0}$ | $\mathbf{0 . 0}$ | $\mathbf{0 . 0}$ |
| Volume of solution A used $(\mathrm{cm} 3)$ | $\mathbf{2 0 . 0}$ | $\mathbf{2 0 . 0}$ | $\mathbf{2 0 . 0}$ |

Sample worked questions

1. Calculate the average volume of solution $A$ used

Average titre $=\frac{\text { Titre } 1+\text { Titre } 2+\text { Titre } 3}{3} \Rightarrow>\left(\frac{20.0+20.0+20.0}{3}\right)=\underline{\mathbf{2 0 . 0 c m}} \underline{ }$

## 2. How many moles of:

(i)solution A were present inin the average titre.

Moles of solution $\mathrm{A}=\frac{\text { Molarity } \mathrm{x} \text { volume }}{1000}=\frac{0.025 \times 20}{1000}=\underline{5.0 \times 10^{-4}} \mathrm{moles}$
(ii)solution C in 25 cm 3 solution given the equation for the reaction:
$\mathrm{MnO}_{4}{ }^{-}(\mathrm{aq})+\mathbf{8 H ^ { + }}(\mathrm{aq})+5 \mathrm{Fe}^{2+}(\mathrm{aq})->\mathrm{Mn}^{2+}(\mathrm{aq})+5 \mathrm{Fe}^{3+}(\mathrm{aq})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
Mole ratio $\mathrm{MnO}_{4}{ }^{-}(\mathrm{aq}): 5 \mathrm{Fe}^{2+}(\mathrm{aq})=1: 5 \quad \Rightarrow$
Moles of $5 \mathrm{Fe}^{2+}(\mathrm{aq})=\frac{\text { Moles of } \mathrm{MnO}_{4}}{5}(\mathrm{aq})=\frac{5.0 \times 10^{-4}}{5}$ moles $=\underline{\mathbf{1 . 0} \times 10^{-4}}$ moles
(iii) solution $B$ in 250 cm 3 .

Moles of B per litre $=\frac{\text { moles } \times 250}{\text { Volume }}=\underline{1.0 \times 10} \frac{-4}{25} \underline{\times 250}=\underline{1.0 \times 10^{-3}}-\mathbf{m o l e s}$
3. Calculate the molar mass of solid C and hence the value of x in the chemical formula $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4} \mathrm{FeSO}_{4} \cdot \mathrm{xH}_{2} \mathrm{O}$.
( $\mathrm{N}=14.0, \mathrm{~S}=32.0, \mathrm{Fe}=56.0, \mathrm{H}=1.0 \mathrm{O}=16.0$ )

$$
x=\underline{454}(\text { whole number })
$$

## (c)Sample Titration Practice 3 (Back titration)

You are provided with:
(i) an impure calcium carbonate labeled M
(ii)Hydrochloric acid labeled solution N
(iii)solution L containing 20 g per litre sodium hydroxide.

You are required to determine the concentration of N in moles per litre and the \% of calcium carbonate in mixture M .

## Procedure 1

Pipette 25.0 cm 3 of solution L into a conical flask. Add 2-3 drops of phenolphthalein indicator. Titrate with dilute hydrochloric acid solution N and record your results in table 1 (4mark)
Sample Table 1

|  | 1 | 2 | 3 |
| :--- | :---: | :---: | :---: |
| Final burette reading (cm3) | $\mathbf{6 . 5}$ | $\mathbf{6 . 5}$ | $\mathbf{6 . 5}$ |
| Initial burette reading (cm3) | $\mathbf{0 . 0}$ | $\mathbf{0 . 0}$ | $\mathbf{0 . 0}$ |
| Volume of N used $(\mathrm{cm} 3)$ | $\mathbf{6 . 5}$ | $\mathbf{6 . 5}$ | $\mathbf{6 . 5}$ |

Sample questions
(a) Calculate the average volume of solution $\mathbf{N}$
$\underline{\text { used } 6.5+6.5+6.5=6.5 \mathrm{~cm} 3}$
3
(b) How many moles of sodium hydroxide are contained in 25 cm 3 of solution L Molar mass $\mathrm{NaOH}=40 \mathrm{~g}$
Molarity of $L=\underline{\text { mass per litre }} \quad \Rightarrow \quad \underline{20}=\underline{0.5 M}$

$$
\begin{aligned}
& \text { Molar mass }=\frac{\text { mass perlitre }}{\text { Moles per litre }}=\quad \frac{8.5}{1.0 \times 10^{-3} \text { moles }}=\underline{\mathbf{8 5 0 0} \mathbf{g}} \\
& \left.\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4} \mathrm{FeSO}_{4} \cdot \mathrm{xH}_{2} \mathrm{O}=8500 \\
& 284+18 x=8500 \\
& 8500-284=\frac{8216}{18}=\frac{18 \mathrm{x}}{18}=\underline{454.4444}
\end{aligned}
$$

Moles NaOH in $25 \mathrm{~cm} 3=\frac{\text { molarity x volume }}{1000} \Rightarrow \frac{0.5 \mathrm{M} \times 25 \mathrm{~cm} 3}{1000}=\underline{\mathbf{0 . 0 1 2 5}} \mathrm{moles}$
(c)Calculate:
(i)the number of moles of hydrochloric acidthat react with sodium hydroxide in (b)above.
Mole ratio NaOH : HCl from stoichiometric equation $=1: 1$
Moles $\mathrm{HCl}=$ Moles $\mathrm{NaOH}=>\underline{\mathbf{0 . 0 1 2 5}} \underline{\text { moles }}$
(ii)the molarity of hydrochloric acid solution $\mathbf{N}$.

$$
\text { Molarity }=\frac{\text { moles } \times 1000}{6.5} \Rightarrow \frac{0.0125 \text { moles } \times 1000=1.9231 \mathrm{M} / \mathrm{moledm}^{-3}}{6.5}
$$

## Procedure 2

Place the 4.0 g of M provided into a conical flask and add 25.0 cm 3 of the dilute hydrochloric acid to it using a clean pipette. Swirl the contents of the flask vigorously until effervescence stop.Using a 100 ml measuring cylinder add 175 cm 3 distilled waterto make up the solution up to 200 cm 3 . Label this solution K.Using a clean pipettetransfer 25.0 cm 3 of the solution into a clean conical flask and titrate with solution L from the burette using 2-3 drops of methyl orange indicator.Record your observations in table 2.

## Sample Table 2

|  | 1 | 2 | 3 |
| :--- | :---: | :---: | :---: |
| Final burette reading (cm3) | 24.5 | 24.5 | 24.5 |
| Initial burette reading (cm3) | 0.0 | 0.0 | 0.0 |
| Volume of N used (cm3) | 24.5 | 24.5 | $\mathbf{2 4 . 5}$ |

Sample calculations
(a)Calculate the average volume of solution $L$ used ( 1 mk )

$$
\frac{24.5+24.5+24.5}{3}=24.5 \mathrm{~cm} 3
$$

(b)How many moles of sodium hydroxide are present in the average volume of solution L used?

$$
\begin{array}{r}
\text { Moles }=\frac{\text { molarity } \times \text { average burette volume }}{1000} \Rightarrow \frac{0.5 \times 24.5}{1000} \\
=\underline{\mathbf{0 . 0 1 2 2 5} / \mathbf{1 . 2 2 5} \times 10^{-2} \mathrm{moles}}
\end{array}
$$

(c) How many moles of hydrochloric acid are present in the original 200 cm 3 of solution $K$ ?

Mole ratio $\mathrm{NaOH}: ~ \mathrm{HCl}=1: 1 \Rightarrow$ moles of $\mathrm{HCl}=\underline{\mathbf{0 . 0 1 2 2 5} / 1.225 \times 10^{-2}} \underline{\text { moles }}$
Moles in $200 \mathrm{~cm} 3=\underline{200 \mathrm{~cm} 3 \times 0.01225 / 1.225 \times 10^{-2} \text { moles }}$
25 cm 3 (volume pipetted)
$=0.49 / 4.9 \times 10^{-1}$ moles
(d)How many moles of hydrochloric acid were contained in original 25 cm3 solution N used

Original moles $=\underline{\text { Original molarity } \times \text { pipetted volume }}=>$ 1000 cm 3

(e)How many moles of hydrochloric acid were used to react with calcium carbonate present?
Moles that reacted $=$ original moles - moles in average titre =>

$$
\begin{aligned}
& 0.04807 / 4.807 \times 10^{-2} \text { moles }-0.01225 / 1.225 \times 10^{-2} \mathrm{moles} \\
& =\underline{0.03582 / 3.582 \times 10} \underline{-2} \text {. moles }
\end{aligned}
$$

(f)Write the equation for the reaction between calcium carbonate and hydrochloric acid.
$\mathrm{CaCO}_{3}(\mathrm{~s})+2 \mathrm{HCl}(\mathrm{aq})->\mathrm{CaCl}_{2}(\mathrm{aq})+\mathrm{CO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
(g)Calculate the number of moles of calcium carbonate that reacted with hydrochloric acid.
From the equation $\mathrm{CaCO}_{3}(\mathrm{~s}): 2 \mathrm{HCl}(\mathrm{aq})=1: 2$

$$
\begin{aligned}
& =>\text { Moles } \mathrm{CaCO}_{3}(\mathrm{~s})=1 / 2 \text { moles } \mathrm{HCl} \\
& =1 / 2 \times 0.03582 / 3.582 \times 10^{-2} \text { moles } \\
& =\underline{\mathbf{0 . 0 1 7 9 1} / 1.791 \times 10^{-2}} \mathrm{moles}
\end{aligned}
$$

(h)Calculate the mass of calcium carbonate in 4.0 g of mixture $\mathrm{M}(\mathrm{Ca}=\mathbf{4 0 . 0 , 0}$
$=16.0, \mathrm{C}=12.0$ )
Molar mass $\mathrm{CaCO}_{3}=100 \mathrm{~g}$
Mass $\mathrm{CaCO}_{3}=$ moles $\times$ molar mass $\Rightarrow 0.01791 / 1.791 \times 10^{-2}$ moles $\times 100 \mathrm{~g}$

$$
=1.791 \mathrm{~g}
$$

(i)Determine the \% of calcium carbonate present in the mixture

$$
\% \mathrm{CaCO}_{3}=\frac{\text { mass of pure } \times 100 \%}{\text { Mass of impure }} \Rightarrow \frac{1.791 \mathrm{~g} \times 100 \%}{4.0}=\underline{44.775 \%}
$$

(d)Sample titration practice 4 (Multiple titration)

You are provided with:
(i)sodium L containing 5.0 g per litre of a dibasic organic acid $\mathrm{H}_{2} \mathrm{X} .2 \mathrm{H}_{2} \mathrm{O}$. (ii)solution M which is acidified potassium manganate(VII)
(iii)solution N a mixture of sodium ethanedioate and ethanedioic acid (iv) 0.1 M sodium hydroxide solution P (v) 1.0 M sulphuric(VI)

You are required to:
(i)standardize solution M using solution L
(ii) use standardized solution M and solution P to determine the $\%$ of sodium ethanedioate in the mixture.

## Procedure 1

Fill the burette with solution M. Pipette 25.0 cm 3 of solution L into a conical flask. Heat this solution to about $70^{\circ} \mathrm{C}$ (but not to boil).Titrate the hot solution L with solution M until a permanent pink colour just appears.Shake thoroughly during the titration. Repeat this procedure to complete table 1.
$\underline{\text { Sample Table } 1}$

|  | 1 | 2 | 3 |
| :--- | :---: | :---: | :---: |
| Final burette reading (cm3) | 24.0 | 24.0 | 24.0 |
| Initial burette reading (cm3) | 0.0 | 0.0 | 0.0 |
| Volume of N used (cm3) | 24.0 | 24.0 | 24.0 |

## Sample calculations

(a)Calculate the average volume of solution $L$ used ( 1 mk )

$$
\frac{24.0+24.0+24.0}{3}=\underline{\mathbf{2 4 . 0}} \mathrm{cm} 3
$$

(b)Given that the concentration of the dibasic acid is 0.05 molesdm $^{-}$
${ }^{3}$.determine the value of $x$ in the formula $\mathrm{H}_{2} \mathrm{X} .2 \mathrm{H}_{2} \mathrm{O}(\mathrm{H}=\mathbf{1 . 0}, \mathrm{O}=16.0)$
Molar mass $\mathrm{H}_{2} \mathrm{X} .2 \mathrm{H}_{2} \mathrm{O}=\frac{\text { mass per litre }}{\text { Moles/litre }} \quad \Rightarrow \quad \frac{5.0 \mathrm{~g} / \text { litre }}{0.05 \mathrm{molesdm}^{-3}}=100 \mathrm{~g}$

$$
\begin{aligned}
& \mathrm{H}_{2} \mathrm{X} .2 \mathrm{H}_{2} \mathrm{O}=100 \\
& \mathrm{X}=100-((2 \times 1)+2 \times(2 \times 1)+(2 \times 16) \Rightarrow 100-\quad 34=\underline{66}
\end{aligned}
$$

(c) Calculate the number of moles of the dibasic acid $\mathbf{H}_{2} X .2 \mathrm{H}_{2} \mathrm{O}$.

Moles $=\frac{\text { molarity } \times \text { pipette volume }}{1000} \Rightarrow \frac{0.5 \times 25}{1000}=0.0125 / 1.25 \times 10^{-2}$ moles
(d)Given the mole ratio manganate( VII )( $\mathrm{MnO}_{4}{ }^{-}$): acid $\mathrm{H}_{2} \mathrm{X}$ is 2:5, calculate the number of moles of manganate(VII) $\left(\mathrm{MnO}_{4}^{-}\right)$in the average titre.

$$
\begin{aligned}
\text { Moles } \mathrm{H}_{2} \mathrm{X} & =2 / 5 \text { moles of } \mathrm{MnO}_{4}^{-} \\
& =2 / 5 \times 0.0125 / 1.25 \times 10^{-2} \text { moles } \\
& =\underline{0.005 / 5.0 \times 10} \underline{-3}^{-3} \text { moles }
\end{aligned}
$$

(e)Calculate the concentration of the manganate(VII)( $\mathrm{MnO}_{4}{ }^{-}$) in moles per litre.

Moles per litre $/$ molarity $=\frac{\text { moles } \mathrm{x} 1000 \text { average }}{\text { burette volume }}$

$$
=>\underline{0.005 / 5.0 \times 10} \frac{-3}{24.0} \frac{\text { moles } \times 1000}{24}=0.2083 \mathrm{molesl}^{-1} / \mathrm{M}
$$

## Procedure 2

With solution M still in the burette , pipette 25.0 cm 3 of solution N into a conical flask. Heat the conical flask containing solution N to about $70^{\circ} \mathrm{C}$. Titrate while hot with solution M.Repeat the experiment to complete table 2.
Sample Table 2

|  | 1 | 2 | 3 |
| :--- | :---: | :---: | :---: |
| Final burette reading $(\mathrm{cm} 3)$ | $\mathbf{1 2 . 5}$ | $\mathbf{1 2 . 5}$ | $\mathbf{1 2 . 5}$ |

| Initial burette reading (cm3) | $\mathbf{0 . 0}$ | $\mathbf{0 . 0}$ | $\mathbf{0 . 0}$ |
| :--- | :--- | :--- | :--- |
| Volume of N used (cm3) | $\mathbf{1 2 . 5}$ | $\mathbf{1 2 . 5}$ | $\mathbf{1 2 . 5}$ |

Sample calculations
(a)Calculate the average volume of solution $L$ used ( 1 mk )

$$
\frac{12.5+12.5+12.5}{3}=\mathbf{1 2 . 5} \mathrm{cm} 3
$$

(b)Calculations:
(i)How many moles of manganate(VII)ions are contained in the average volume of solution $M$ used?

Moles $=\underline{\text { molarity }}$ of solution Mx average burette volume

$$
1000
$$

$\Rightarrow \quad \frac{0.2083 \mathrm{molesl}^{-1} / \mathrm{M} \mathrm{x} \mathrm{12.5}}{1000}=\underline{\mathbf{0 . 0 0 2 6} / 2.5 \times 10^{-3}} \mathrm{moles}$
(ii)The reaction between manganate(VII)ions and ethanedioate ions that reacted with is as in the equation:
$\mathbf{2} \mathrm{MnO}_{4}{ }^{-}(\mathrm{aq})+\mathbf{5 \mathrm { C } _ { 2 } \mathrm { O } _ { 4 } { } ^ { \mathbf { 2 - } } ( \mathrm { aq } ) + \mathbf { 1 6 } \mathrm { H } ^ { + } ( \mathrm { aq } ) - > 2 \mathrm { Mn } ^ { 2 + } ( \mathrm { aq } ) + \mathbf { 1 0 \mathrm { CO } _ { 2 } } ( \mathrm { g } ) + \mathbf { 8 } \mathbf { H } _ { 2 } \mathrm { O } ( \mathrm { l } )}$
Calculate the number of moles of ethanedioate ions that reacted with manganate (VII) ions in the average volume of solution M.

From the stoichiometric equation, mole ratio $\mathrm{MnO}_{4}{ }^{-}(\mathrm{aq}): \mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}(\mathrm{aq})=2: 5$
$\Rightarrow$ moles $\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}=5 / 2$ moles $\mathrm{MnO}_{4}{ }^{-}=>5 / 2 \times 0.0026 / 2.5 \times 10^{-3}$ moles

$$
=\underline{0.0065 / 6.5 \times 10^{-3}} \mathrm{moles}
$$

(iii) Calculate the number of moles of ethanedioate ions contained in 250 cm 3 solution $\mathbf{N}$.

25 cm 3 pipette $\quad$-> $0.0065 / 6.5 \times 10-3$ moles
volume 250 cm 3 ->

$$
\underline{0.0065 / 6.5 \times 10^{-3}} \underline{\text { moles } \times 250}=\underline{0.065 / 6.5 \times 10^{-2} \text { moles }}
$$

Procedure 3

Remove solution M from the burette and rinse it with distilled water. Fill the burette with sodium hydroxide solution P. Pipette 25 cm 3 of solution N into a conical flask and add 2-3 drops of phenolphthalein indicator. Titrate this solution N with solution P from the burette. Repeat the procedure to complete table 3.
Sample Table 2

|  | 1 | 2 | 3 |
| :--- | :---: | :---: | :---: |
| Final burette reading (cm3) | 24.9 | 24.9 | 24.9 |
| Initial burette reading (cm3) | $\mathbf{0 . 0}$ | $\mathbf{0 . 0}$ | $\mathbf{0 . 0}$ |
| Volume of N used (cm3) | 24.9 | $\mathbf{2 4 . 9}$ | $\mathbf{2 4 . 9}$ |

Sample calculations
(a)Calculate the average volume of solution $L$ used ( 1 mk )

$$
\frac{24.9+24.9+24.9}{3}=24.9 \mathrm{~cm} 3
$$

## (b)Calculations:

(i)How many moles of sodium hydroxide solution $P$ were contained in the average volume?

$$
\begin{aligned}
& \text { Moles }= \\
&=\quad \text { molarity of solution P } \times \text { average burette volume } \\
& 1000 \\
& \Rightarrow \quad \frac{0.1 \mathrm{molesl}^{-1} \times 24.9}{1000}=\mathbf{0 . 0 0 2 4 9 / 2 . 4 9 \times 1 0 ^ { - 3 }} \mathrm{moles}
\end{aligned}
$$

(ii)Given that NaOH solution P reacted with the ethanedioate ions from the acid only and the equation for the reaction is:
$\mathbf{2 N a O H}(\mathrm{aq})+\mathbf{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}(\mathrm{aq})->\mathrm{Na}_{2} \mathrm{C}_{2} \mathrm{O}_{4}(\mathrm{~g})+\mathbf{2} \mathbf{H}_{2} \mathrm{O}(\mathrm{l})$
Calculate the number of moles of ethanedioic acid that were used in the reaction

From the stoichiometric equation, mole ratio $\mathrm{NaOH}(\mathrm{aq}): \mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}(\mathrm{aq})=2: 1$ $\Rightarrow$ moles $\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}=1 / 2$ moles $\mathrm{NaOH} \Rightarrow 1 / 2 \times 0.00249 / 2.49 \times 10^{-3}$ moles

$$
=\underline{0.001245 / 1.245 \times 10^{-3}} \text { moles. }
$$

(iii)How many moles of ethanedioic acid were contained in 250 cm 3 of solution N?

25 cm 3 pipette volume -> $0.001245 / 1.245 \times 10-3$ moles 250 cm 3

$$
\frac{0.001245 / 1.245 \times 10^{-3}}{25} \underline{\text { moles x } 250}=\frac{\mathbf{0 . 0 1 2 4 5 / 1 . 2 4 5 \times 1 0 ^ { - 2 }} \text { moles }}{}
$$

(iii)Determine the \% by mass of sodium ethanedioate in the micture ( $\mathrm{H}=1.0, \mathrm{O}=16.0, \mathrm{C}=12.0$ and total mass of mixture $=\mathbf{2 . 0} \mathrm{g}$ in 250 cm 3 solution)

Molar mass $\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}=90.0 \mathrm{~g}$
Mass of $\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}$ in $250 \mathrm{~cm} 3=$ moles in $250 \mathrm{~cm} 3 \times$ molar mass $\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O} 4$

$$
\begin{aligned}
& =>0.01245 / 1.245 \times 10^{-2} \text { moles } \times 90.0 \\
& =\underline{\mathbf{1 . 1 2 0 5}}
\end{aligned}
$$

\% by mass of sodium ethanedioate
$=\left(\right.$ Mass of mixture - mass of $\left.\mathrm{H}_{2} \underline{\mathrm{C}}_{2} \underline{\mathrm{O}}_{4}\right) \times 100 \%$
Mass of mixture

$$
\Rightarrow \frac{2.0-1.1205 \mathrm{~g}}{2.0}=\underline{43.975 \%}
$$

## Note

(i) L is 0.05 M Oxalic acid
(ii) M is $0.01 \mathrm{M} \mathrm{KMnO4}$
(iii) N is 0.03 M oxalic acid(without sodium oxalate)

## Practice example 5.(Determining equation for a reaction)

You are provided with
-0.1 M hydrochloric acid solution A
-0.5 M sodium hydroxide solution B
You are to determine the equation for thereaction between solution A and B Procedure
Fill the burette with solution A.Using a pipette and pipette filler transfer 25.0 cm 3 of solution B into a conical flask.Add 2-3 drops of phenolphthalein indicator.Run solution A into solution B until a permanent pink colour just appears.Record your results in Table 1.Repeat the experiment to obtain three concordant results to complete Table 1
Table 1(Sample results)

| Titration | 1 | 2 | 3 |
| :--- | :--- | :--- | :--- |
| Final volume $(\mathrm{cm} 3)$ | $\mathbf{1 2 . 5}$ | $\mathbf{2 5 . 0}$ | $\mathbf{3 7 . 5}$ |
| Initial volume $(\mathrm{cm} 3)$ | $\mathbf{0 . 0}$ | $\mathbf{1 2 . 5}$ | $\mathbf{2 5 . 0}$ |
| Volume of solution A used $(\mathrm{cm} 3)$ | $\mathbf{1 2 . 5}$ | $\mathbf{1 2 . 5}$ | $\mathbf{1 2 . 5}$ |

## Sample questions

Calculate the average volume of solution $A$ used.
$\frac{12.5+12.5+12.5}{3}=12.5 \mathrm{~cm} 3$

## Theoretical Practice examples

1. 1.0 g of dibasic acid $\mathrm{HOOC}\left(\mathrm{CH}_{2}\right)_{\mathbf{x}} \mathrm{COOH}$ was dissolved in 250 cm 3 solution. 25.0 cm 3 of this solution reacted with 30.0 cm 3 of 0.06 M sodium hydroxide solution. Calculate the value of $x$ in $\mathrm{HOOC}\left(\mathrm{CH}_{2}\right)_{x} \mathrm{COOH}$. ( $\mathrm{C}=12.0, \mathrm{H}=1.0, \mathrm{O}=16$.)

Chemical equation

$$
2 \mathrm{NaOH}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{X}(\mathrm{aq})->\mathrm{Na}_{2} \mathrm{X}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{aq})
$$

Mole ratio $\mathrm{NaOH}(\mathrm{aq}): \mathrm{H}_{2} \mathrm{X}(\mathrm{aq})=2: 1$
Method 1

$$
\frac{\mathrm{MaVa}=\mathrm{na}}{\mathrm{Mb} \mathrm{Vb=nb}} \quad \Rightarrow \frac{\mathrm{Ma} \times 25.0}{0.06 \times 30.0}=\frac{1}{2} \Rightarrow \mathrm{Ma}=\frac{0.06 \times 30.0 \times 1}{25.0 \times 2}
$$

\end{array}=\mathbf{0 . 0 8 m o l e s}
$$

Original moles of $\mathrm{HCl}=$ Molarity x volume $=>1 \mathrm{M} \times 1$ litre $=\underline{\mathbf{1 . 0} \mathbf{~ m o l e s}}$

Moles of HCl reacted with $\mathrm{MCO}_{3}=\mathbf{1 . 0} \mathbf{- 0 . 0 8}$ moles $=\mathbf{0 . 9 2 m o l e s}$ Chemical equation
$\mathrm{MCO}_{3(\mathrm{~s})}+2 \mathrm{HCl}_{(\mathrm{aq})} \quad$-> $\quad \mathrm{MCl}_{2(\mathrm{aq})}+\mathrm{CO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})}$
Mole ratio $\mathrm{MCO}_{3(\mathrm{~s})}: \mathrm{HCl}_{(\mathrm{aq})}=1: 2$
Moles of $\mathrm{MCO}_{3}=\frac{0.92 \text { moles }}{2} \Rightarrow \mathbf{0 . 4 6 m o l e s}$
Molar mass of $\mathrm{MCO}_{3}=\frac{\text { mass }}{\text { moles }} \Rightarrow \quad \frac{46 \mathrm{~g}}{0.46 \mathrm{moles}}=100 \mathrm{~g}$
$\mathrm{M}=\mathrm{MCO}_{3}-\mathrm{CO}_{3}=>100 \mathrm{~g}-(12+16 \times 3=60)=40$
6. 25.0 cm 3 of a mixture of $\mathrm{Fe}^{2+}$ and $\mathrm{Fe}^{3+}$ ions in an aqueous salt was acidified with sulphuric(VI)acid then titrated against potassium manganate(VI).The salt required 15 cm 3 ofe 0.02 M potassium manganate(VI) for complete reaction.
A second 25 cm 3 portion of the $\mathrm{Fe}^{2+}$ and $\mathrm{Fe}^{3+}$ ion salt was reduced by Zinc then titrated against the same concentration of potassium manganate(VI). 19.0 cm 3 of potassium manganate(VI)solution was used for complete reaction. Calculate the concentration of $\mathrm{Fe}^{2+}$ and $\mathrm{Fe}^{3+}$ ion in the solution on moles per litre.

Mole ratio $\mathrm{Fe}^{2+}: \mathrm{Mn}^{2}{ }_{4} \quad-=5: 1$
Moles $\mathrm{Mn}^{4}-$ used $=\frac{0 . \underline{02} \times 15}{1000} \quad=\mathbf{3 . 0} \times \mathbf{1 0}^{-4}$ moles
Moles $\mathrm{Fe}^{2+} \quad=\frac{3.0 \times 10^{-4} \mathrm{moles}}{5} \quad=\quad \mathbf{6 . 0} \times 10^{-\mathbf{3}} \mathrm{moles}$
Molarity of $\mathbf{F e}^{2+}=\frac{\mathbf{6 . 0} \times 10^{-4} \text { moles } \times 1000}{25}=\underline{\underline{\mathbf{2} .4} \times \mathbf{1 0}^{-3} \mathrm{moles} \mathrm{l}^{-1}}$
Since Zinc reduces $\mathrm{Fe}^{\mathbf{3 +}}$ to $\mathrm{Fe}^{2+}$ in the mixture:
Moles $\mathrm{Mn} 0_{4}{ }^{-}$that reacted with all $\mathbf{F e}^{\text {L+ }}=\frac{0.02 \times 19}{1000}=\mathbf{3 . 8 \times 1 0 ^ { - 4 }}$ moles

| Moles of all $\mathrm{Fe}^{2+}$ | $=\frac{3.8 \times 10^{-4} \mathrm{moles}}{5}=7.6 \times 10^{-3}$ moles |
| :--- | :--- |
| Moles of $\mathrm{Fe}^{3+}$ | $=3.8 \times 10^{-4}-6.0 \times 10^{-5}=$ |
| Molarity of $\mathrm{Fe}^{3+}$ | $=\frac{1.6 \times 10^{-5} \mathrm{moles} \times 1000}{25}=\underline{\mathbf{1 . 6 \times 1 0} \mathbf{0 - 5} \mathrm{moles}}$ |

# 14.0.0 ORGANIC CHEMISTRY I <br> (HYDROCARBONS) ( 25 LESSONS) 

## Introduction to Organic chemistry

Organic chemistry is the branch of chemistry that studies carbon compounds present in living things, once living things or synthetic/man-made.
Compounds that makes up living things whether alive or dead mainly contain carbon. Carbon is tetravalent.
It is able to form stable covalent bonds with itself and many non-metals like hydrogen, nitrogen ,oxygen and halogens to form a variety of compounds. This is because:
(i) carbon uses all the four valence electrons to form four strong covalent bond.
(ii)carbon can covalently bond to form a single, double or triple covalent bond with itself.
(iii)carbon atoms can covalently bond to form a very long chain or ring. When carbon covalently bond with Hydrogen, it forms a group of organic compounds called Hydrocarbons

## A.HYDROCARBONS (HCs)

Hydrocarbons are a group of organic compounds containing /made up of hydrogen and carbon atoms only.
Depending on the type of bond that exist between the individual carbon atoms, hydrocarbon are classified as:
(i) Alkanes
(ii) Alkenes
(iii) Alkynes

## (i) Alkanes

## (a)Nomenclature/Naming

These are hydrocarbons with a general formula $\mathbf{C}_{\mathbf{n}} \mathbf{H}_{2 n+2}$ where $\mathbf{n}$ is the number of Carbon atoms in a molecule.
The carbon atoms are linked by single bond to each other and to hydrogen atoms.

They include:

| n | General/ Molecular formula | Structural formula | Name |
| :---: | :---: | :---: | :---: |
| 1 | $\mathrm{CH}_{4}$ |  | Methane |
| 2 | $\mathrm{C}_{2} \mathrm{H}_{6}$ |  | Ethane |
| 3 | $\mathrm{C}_{3} \mathrm{H}_{8}$ |  | Propane |
| 4 | $\mathrm{CH}_{4} \mathrm{H}_{10}$ |  | Butane |
| 5 | $\mathrm{C}_{5} \mathrm{H}_{12}$ |  | Pentane |
| 6 | $\mathrm{C}_{6} \mathrm{H}_{14}$ |  | Hexane |

|  |  |  |  |
| :---: | :---: | :---: | :---: |
| 7 | $\mathrm{CH}_{7} \mathrm{H}_{16}$ |  | Heptane |
| 8 | $\mathrm{CH}_{8} \mathrm{H}_{18}$ |  | Octane |
| 9 | $\mathrm{CH}_{9} \mathrm{H}_{20}$ |  | Nonane |
| 10 | $\mathrm{C}_{10} \mathrm{H}_{22}$ |  | decane |

## Note

1.The general formula/molecular formular of a compound shows the number of each atoms of elements making the compound e.g.
Decane has a general/molecular formula $\mathbf{C 1 0}_{\mathbf{1 0}} \mathbf{\mathbf { H } _ { 2 2 }}$; this means there are 10 carbon atoms and 22 hydrogen atoms in a molecule of decane.
2.The structural formula shows the arrangement/bonding of atoms of each element making the compound e.g
Decane has the structural formula as in the table above ;this means the $1^{\text {st }}$ carbon from left to right is bonded to three hydrogen atoms and one carbon atom.
The $2^{\text {nd }}$ carbon atom is joined/bonded to two other carbon atoms and two Hydrogen atoms.
3.Since carbon is tetravalent ,each atom of carbon in the alkane MUST always be bonded using four covalent bond /four shared pairs of electrons.
4.Since Hydrogen is monovalent ,each atom of hydrogen in the alkane MUST always be bonded using one covalent bond/one shared pair of electrons.
5.One member of the alkane differ from the next/previous by a $\mathrm{CH}_{2}$ group. e.g

Propane differ from ethane by one carbon and two Hydrogen atoms form ethane. Ethane differ from methane also by one carbon and two Hydrogen atoms 6.A group of compounds that differ by a $\mathrm{CH}_{2}$ group from the next /previous consecutively is called a homologous series.
7.A homologous series:
(i) differ by a $\mathrm{CH}_{2}$ group from the next /previous consecutively
(ii)have similar chemical properties
(iii)have similar chemical formula that can be represented by a general formula e.g alkanes have the general formula $\mathrm{C}_{\mathrm{n}} \mathrm{H}_{2 \mathrm{n}+2}$.
(iv)the physical properties (e.g.melting/boiling points)show steady gradual change)
8.The $1^{\text {st }}$ four alkanes have the prefix meth_,eth_,prop_ and but_ to represent $1,2,3$ and 4 carbons in the compound. All other use the numeral prefix pent_,Hex_,hept_ , etc to show also the number of carbon atoms. 9.If one hydrogen atom in an alkane is removed, an alkyl group is formed.e.g

| Alkane name | molecular structure <br> $\mathbf{C}_{\mathbf{n}} \mathbf{H}_{2 n+2}$ | Alkyl name | $\mathbf{M o l e c u l a ~ s t r u c t u r e ~}_{\mathbf{C}_{\mathbf{n}} \mathbf{H}_{\mathbf{n}+1}}$ |
| :--- | :--- | :--- | :--- |
| methane | $\mathrm{CH}_{4}$ | methyl | $\mathbf{C H}_{\mathbf{3}}$ |
| ethane | $\mathrm{CH}_{3} \mathrm{CH}_{3}$ | ethyl | $\mathbf{C H}_{\mathbf{3}} \mathbf{C H}_{\mathbf{2}}$ |
| propane | $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{3}$ | propyl | $\mathbf{C H}_{\mathbf{3}} \mathbf{C H}_{\mathbf{2}} \mathbf{C H}_{\mathbf{2}}$ |
| butane | $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ | butyl | $\mathbf{C H}_{\mathbf{3}} \mathbf{C H}_{\mathbf{2}} \mathbf{C H}_{\mathbf{2}} \mathbf{C H}_{\mathbf{2}}$ |

## (b)Isomers of alkanes

Isomers are compounds with the same molecular general formula but different molecular structural formula.
Isomerism is the existence of a compounds having the same general/molecular formula but different structural formula.
The $1^{\text {st }}$ three alkanes do not form isomers.Isomers are named by using the
IUPAC(International Union of Pure and Applied Chemistry) system of nomenclature/naming.
The IUPAC system of nomenclature uses the following basic rules/guidelines:
1.Identify the longest continuous carbon chain to get/determine the parent alkane.
2.Number the longest chain form the end of the chain that is near the branches so as the branch get the lowest number possible
3. Determine the position, number and type of branches. Name them as methyl, ethyl, propyl e.tc. according to the number of carbon chains attached to the parent alkane. Name them fluoro-,chloro-,bromo-,iodo- if they are halogens
4.Use prefix di-,tri-,tetra-,penta-,hexa- to show the number of branches attached to the parent alkane.

Practice on IUPAC nomenclature of alkanes
(a)Draw the structure of:

## (i)2-methylpentane

Procedure

1. Identify the longest continuous carbon chain to get/determine the parent alkane.

Butane is the parent name $\quad \mathbf{C H}_{\mathbf{3}} \mathbf{C H}_{\mathbf{2}} \mathbf{C H}_{\mathbf{2}} \mathbf{C H}_{\mathbf{3}}$
2. Number the longest chain form the end of the chain that is near the branches so as the branch get the lowest number possible
The methyl group is attached to Carbon " 2 "
3. Determine the position, number and type of branches. Name them as methyl, ethyl, propyl e.tc. according to the number of carbon chains attached to the parent alkane i.e

Position of the branch at carbon " 2 "
Number of branches at carbon " 1 "
Type of the branch "methyl" hence
Molecular formula

## $\mathrm{CH}_{3}$

$\mathrm{CH}_{3} \mathbf{C H} \mathrm{CH}_{2} \mathrm{CH}_{3} / / \mathrm{CH}_{3} \mathbf{C H}\left(\mathrm{CH}_{3}\right) \mathbf{C H}_{2} \mathrm{CH}_{3}$
Structural formula

## (ii)2,2-dimethylpentane

Procedure

1. Identify the longest continuous carbon chain to get/determine the parent alkane.

Butane is the parent name $\quad \mathbf{C H}_{\mathbf{3}} \mathbf{C H}_{\mathbf{2}} \mathbf{C H}_{\mathbf{2}} \mathbf{C H}_{\mathbf{3}}$
2. Number the longest chain form the end of the chain that is near the branches so as the branch get the lowest number possible The methyl group is attached to Carbon " 2 "
3. Determine the position, number and type of branches. Name them as methyl, ethyl, propyl e.tc. according to the number of carbon chains attached to the parent alkane i.e

Position of the branch at carbon " 2 "
Number of branches at carbon " 2 " Type
of the branch two"methyl" hence
Molecular formular

$\mathrm{CH}_{3} \underset{\mid}{\mathrm{C} C \mathrm{CH}_{2} \mathrm{CH}_{3} / / \mathrm{CH}_{3} \mathrm{C}\left(\mathrm{CH}_{3}\right)_{2} \mathbf{C H}_{2} \mathrm{CH}_{3}}$
$\mathrm{CH}_{3}$
Structural formula

## (iii) 2,2,3-trimethylbutane

Procedure

1. Identify the longest continuous carbon chain to get/determine the parent alkane.

Butane is the parent name $\quad \mathbf{C H}_{\mathbf{3}} \mathbf{C H}_{\mathbf{2}} \mathbf{C H}_{\mathbf{2}} \mathbf{C H}_{\mathbf{3}}$
2. Number the longest chain form the end of the chain that is near the branches so as the branch get the lowest number possible The methyl group is attached to Carbon " $\mathbf{2}$ and 3"
3. Determine the position, number and type of branches. Name them as methyl, ethyl, propyl e.tc. according to the number of carbon chains attached to the parent alkane i.e

Position of the branch at carbon " 2 and
3 " Number of branches at carbon " 3 "
Type of the branch three "methyl" hence
Molecular formular
$\mathrm{CH}_{3}$

## (c)Occurrence and extraction

Crude oil ,natural gas and biogas are the main sources of alkanes:
(i)Natural gas is found on top of crude oil deposits and consists mainly of methane.
(ii)Biogas is formed from the decay of waste organic products like animal dung and cellulose. When the decay takes place in absence of oxygen , $60-75 \%$ by volume of the gaseous mixture of methane gas is produced.
(iii)Crude oil is a mixture of many flammable hydrocarbons/substances. Using fractional distillation, each hydrocarbon fraction can be separated from the other. The hydrocarbon with lower /smaller number of carbon atoms in the chain have lower boiling point and thus collected first.

As the carbon chain increase, the boiling point, viscosity (ease of flow) and colour intensity increase as flammability decrease. Hydrocarbons in crude oil are not pure. They thus have no sharp fixed boiling point.

Uses of different crude oil fractions

| Carbon atoms in a molecule | Common name of fraction | Uses of fraction |
| :--- | :--- | :--- |
| $1-4$ | Gas | L.P.G gas for domestic <br> use |
| $5-12$ | Petrol | Fuel for petrol engines |
| $9-16$ | Kerosene/Paraffin | Jet fuel and domestic <br> lighting/cooking |
| $15-18$ | Light diesel | Heavy diesel engine <br> fuel |
| $18-25$ | Diesel oil | Light diesel engine fuel |
| $20-70$ | Lubricating oil | Lubricating oil to <br> reduce friction. |
| Over 70 | Bitumen/Asphalt | Tarmacking roads |

## (d)School laboratory preparation of alkanes

In a school laboratory, alkanes may be prepared from the reaction of a sodium alkanoate with solid sodium hydroxide/soda lime.
Chemical equation:
$\begin{array}{lllllll}\text { Sodium alkanoate } & + & \text { soda lime } & -> & \text { alkane } & + & \text { Sodium carbonate } \\ \mathrm{C}_{n} \mathrm{H}_{2 n+1} \mathrm{COONa}(\mathrm{s}) & + & \mathrm{NaOH}(\mathrm{s}) & -> & \mathrm{C} & \mathrm{H} & + \\ \mathrm{Na}_{2} \mathrm{CO}_{3}(\mathrm{~s})\end{array}$
$\mathrm{C}_{\mathrm{n}} \mathrm{H}_{2 \mathrm{n}+1} \mathrm{COONa}(\mathrm{s})+\mathrm{NaOH}(\mathrm{s}) \quad->\mathrm{CH} \quad+\quad \mathrm{Na}_{2} \mathrm{CO}_{3}(\mathrm{~s})$
The " H " in NaOH is transferred/moves to the $\mathrm{C}_{\mathrm{n}} \mathrm{H}_{2 \mathrm{n}+1}$ in $\mathrm{C}_{\mathrm{n}} \mathrm{H}_{2 \mathrm{n}+1} \mathrm{COONa}(\mathrm{s})$ to form C $\mathrm{H}_{2 n+2}$.

## Examples

1. Methane is prepared from the heating of a mixture of sodium ethanoate and soda lime and collecting over water Sodium ethanoate + soda lime -> methane + Sodium carbonate $\mathrm{CH}_{3} \mathrm{COONa}(\mathrm{s})+\mathrm{NaOH}(\mathrm{s}) \quad->\mathrm{CH}_{4}+\mathrm{Na}_{2} \mathrm{CO}_{3}(\mathrm{~s})$

The " H " in NaOH is transferred/moves to the $\mathrm{CH}_{3}$ in $\mathrm{CH}_{3} \mathrm{COONa}$ (s) to form $\mathrm{CH}_{4}$.
2. Ethane is prepared from the heating of a mixture of sodium propanoate and soda lime and collecting over water

Sodium propanoate + soda lime $->$ ethane + Sodium carbonate
$\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COONa}(\mathrm{s})+\mathrm{NaOH}(\mathrm{s}) \quad->\mathrm{CH}_{3} \mathrm{CH}_{3}+\mathrm{Na}_{2} \mathrm{CO}_{3}(\mathrm{~s})$
The " H " in NaOH is transferred/moves to the $\mathrm{CH}_{3} \mathrm{CH}_{2}$ in $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COONa}$ (s) to form $\mathrm{CH}_{3} \mathrm{CH}_{3}$
3. Propane is prepared from the heating of a mixture of sodium butanoate and soda lime and collecting over water

| Sodium butanoate | + | soda lime | $->$ | propane |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{COON}(\mathrm{s})$ | + | Sodium carbonate |  |  |

$\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{COONa}(\mathrm{s})+\mathrm{NaOH}(\mathrm{s}) \quad->\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{3}+\mathrm{Na}_{2} \mathrm{CO}_{3}(\mathrm{~s})$

The " H " in NaOH is transferred/moves to the $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2}$ in $\mathrm{CH}_{3}$
$\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{COONa}$ (s) to form $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{3}$
4. Butane is prepared from the heating of a mixture of sodium pentanoate and soda lime and collecting over water
Sodium pentanoate + soda lime -> butane + Sodium carbonate $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{COONa}(\mathrm{s})+\mathrm{NaOH}(\mathrm{s})$-> $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}+\mathrm{Na}_{2} \mathrm{CO}_{3}(\mathrm{~s})$

The " H " in NaOH is transferred/moves to the $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ in $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{COONa}$ (s) to form $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$

Laboratory set up for the preparation of alkanes

## (d)Properties of alkanes

## I. Physical properties

Alkanes are colourless gases, solids and liquids that are not poisonous. They are slightly soluble in water.
The solubility decrease as the carbon chain and thus the molar mass increase The melting and boiling point increase as the carbon chain increase.
This is because of the increase in van-der-waals /intermolecular forces as the carbon chain increase.
The $1^{\text {st }}$ four straight chain alkanes (methane,ethane, propane and butane)are therefore gases ,the nect six(pentane ,hexane, heptane,octane,nonane, and decane) are liquids while the rest from unidecane(11 carbon atoms) are solids .

The density of straight chain alkanes increase with increasing carbon chain as the intermolecular forces increases.
This reduces the volume occupied by a given mass of the compound.
Summary of physical properties of alkanes

| Alkane | General <br> formula | Melting <br> point(K) | Boiling <br> point(K) $)$ | Density <br> $\mathrm{gcm}^{-3}$ | State at room(298K) <br> temperature and pressure <br> atmosphere (101300Pa) |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Methane | CH 4 | 90 | 112 | 0.424 | gas |

| Ethane | $\mathrm{CH}_{3} \mathrm{CH}_{3}$ | 91 | 184 | 0.546 | gas |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Propane | $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{3}$ | 105 | 231 | 0.501 | gas |
| Butane | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{3}$ | 138 | 275 | 0.579 | gas |
| Pentane | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}_{3}$ | 143 | 309 | 0.626 | liquid |
| Hexane | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{3}$ | 178 | 342 | 0.657 | liquid |
| Heptane | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{5} \mathrm{CH}_{3}$ | 182 | 372 | 0.684 | liquid |
| Octane | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{6} \mathrm{CH}_{3}$ | 216 | 399 | 0.703 | liquid |
| Nonane | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{7} \mathrm{CH}_{3}$ | 219 | 424 | 0.708 | liquid |
| Octane | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{8} \mathrm{CH}_{3}$ | 243 | 447 | 0.730 | liquid |

## II.Chemical properties (i)Burning.

Alkanes burn with a blue/non-luminous non-sooty/non-smoky flame in excess air to form carbon(IV) oxide and water.
Alkane + Air $->\quad$ carbon(IV) oxide $+\quad$ water (excess air/oxygen)
Alkanes burn with a blue/non-luminous no-sooty/non-smoky flame in limited air to form carbon(II) oxide and water.
Alkane + Air -> carbon(II) oxide $+\quad$ water (limited air)

## Examples

1.(a) Methane when ignited burns with a blue non sooty flame in excess air to form carbon(IV) oxide and water.

| Methane | + | Air | $->$ | carbon $(\mathbf{I V})$ oxide |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{CH}_{4}(\mathrm{~g})$ | + | water (excess air/oxygen) |  |  |
| $2 \mathrm{O}_{2}(\mathrm{~g})$ | $->\mathrm{CO}_{2}(\mathrm{~g})$ | $+\quad 2 \mathrm{H}_{2} \mathrm{O}(1 / \mathrm{g})$ |  |  |

(b) Methane when ignited burns with a blue non sooty flame in limited air to form carbon(II) oxide and water.
Methane + Air $->$ carbon(II) oxide $+\quad$ water (excess air/oxygen) $2 \mathrm{CH}_{4}(\mathrm{~g})+3 \mathrm{O}_{2}(\mathrm{~g}) \quad->2 \mathrm{CO}(\mathrm{g}) \quad+4 \mathrm{H}_{2} \mathrm{O}(1 / \mathrm{g})$
2.(a) Ethane when ignited burns with a blue non sooty flame in excess air to form carbon(IV) oxide and water.

| Ethane | + | Air | $->$ | carbon $(\mathbf{I V})$ oxide + |
| :--- | :--- | :--- | :--- | :--- |
| $2 \mathrm{C}_{2} \mathrm{H}_{6}(\mathrm{~g})$ | + | water (excess air/oxygen) |  |  |
| $7 \mathrm{O}_{2}(\mathrm{~g})$ | $->4 \mathrm{CO}_{2}(\mathrm{~g})$ | $+\quad 6 \mathrm{H}_{2} \mathrm{O}(\mathrm{l} / \mathrm{g})$ |  |  |

(b) Ethane when ignited burns with a blue non sooty flame in limited air to form carbon(II) oxide and water.

3.(a) Propane when ignited burns with a blue non sooty flame in excess air to form carbon(IV) oxide and water.

| Propane | + | Air | carbon $(\mathbf{I V})$ oxide | + |
| :---: | :--- | :--- | :--- | :--- |
| $\mathrm{C}_{3} \mathrm{H}_{8}(\mathrm{~g})$ | + | water (excess air/oxygen) |  |  |
| $5 \mathrm{O}_{2}(\mathrm{~g})$ | $->3 \mathrm{CO}_{2}(\mathrm{~g})$ | $+4 \mathrm{H}_{2} \mathrm{O}(1 / \mathrm{g})$ |  |  |

(b) Ethane when ignited burns with a blue non sooty flame in limited air to form carbon(II) oxide and water.

| Ethane | + | Air | $->$ | carbon (II) oxide | + | water (excess air/oxygen) |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $2 \mathrm{C}_{3} \mathrm{H}_{8}(\mathrm{~g})$ | + | $7 \mathrm{O}_{2}(\mathrm{~g})$ | $->\quad 6 \mathrm{CO}(\mathrm{g})$ | $+\quad 8 \mathrm{H}_{2} \mathrm{O}(1 / \mathrm{g})$ |  |  |

## ii)Substitution

Substitution reaction is one in which a hydrogen atom is replaced by a halogen in presence of ultraviolet light.
Alkanes react with halogens in presence of ultraviolet light to form halogenoalkanes. During substitution:
(i)the halogen molecule is split into free atom/radicals.
(ii)one free halogen radical/atoms knock /remove one hydrogen from the alkane leaving an alkyl radical.
(iii) the alkyl radical combine with the other free halogen atom/radical to form halogenoalkane.
(iv)the chlorine atoms substitute repeatedly in the alkane. Each substitution removes a hydrogen atom from the alkane and form hydrogen halide.
(v)substitution stops when all the hydrogen in alkanes are replaced with halogens.

Substitution reaction is a highly explosive reaction in presence of sunlight / ultraviolet light that act as catalyst.

## Examples of substitution reactions

Methane has no effect on bromine or chlorine in diffused light/dark. In sunlight , a mixture of chlorine and methane explode to form colourless mixture of chloromethane and hydrogen chloride gas. The pale green colour of chlorine gas fades.
Chemical equation
1.(a)Methane + chlorine -> Chloromethane + Hydrogen chloride
$\mathrm{CH}_{4}(\mathrm{~g}) \quad+\quad \mathrm{Cl}_{2}(\mathrm{~g})->\quad \mathrm{CH}_{3} \mathrm{Cl}(\mathrm{g}) \quad+\quad \mathrm{HCl}(\mathrm{g})$

(b) Chloromethane + chlorine $->$ dichloromethane + Hydrogen chloride $\mathrm{CH}_{3} \mathrm{Cl}(\mathrm{g}) \quad+\quad \mathrm{Cl}_{2}(\mathrm{~g}) \quad->\mathrm{CH}_{2} \mathrm{Cl}_{2}(\mathrm{~g}) \quad+\quad \mathrm{HCl}(\mathrm{g})$

(c) dichloromethane + chlorine $\quad->$ trichloromethane + Hydrogen chloride

$$
\mathrm{CH}_{2} \mathrm{Cl}_{2}(\mathrm{~g}) \quad+\quad \mathrm{Cl}_{2}(\mathrm{~g}) \quad->\mathrm{CHCl}_{3}(\mathrm{~g}) \quad+\quad \mathrm{HCl}(\mathrm{~g})
$$

(c) trichloromethane + chlorine $->$ tetrachloromethane + Hydrogen chloride

Ethane has no effect on bromine or chlorine in diffused light/dark. In sunlight , a mixture of bromine and ethane explode to form colourless mixture of bromoethane and hydrogen chloride gas. The red/brown colour of bromine gas fades.
Chemical equation
(a)Ethane + chlorine -> Chloroethane + Hydrogen chloride

$$
\mathrm{CH}_{3} \mathrm{CH}_{3}(\mathrm{~g})+\mathrm{Br}_{2}(\mathrm{~g})->\quad \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{Br}(\mathrm{~g}) \quad+\quad \mathrm{HBr}(\mathrm{~g})
$$

1,1-dibromoethane

1,1,1-tribromoethane

1,1,1,2-tetrabromoethane

Br

## Uses of alkanes

1.Most alkanes are used as fuel e.g. Methane is used as biogas in homes.Butane is used as the Laboratory gas.
2.On cracking ,alkanes are a major source of Hydrogen for the manufacture of ammonia/Haber process.
3.In manufacture of Carbon black which is a component in printers ink.
4.In manufacture of useful industrial chemicals like methanol, methanol, and chloromethane.
(ii) Alkenes

## (a)Nomenclature/Naming

$$
1 \quad 1
$$

These are hydrocarbons with a general formula $\mathrm{C}_{n} \mathrm{H}_{2 n}$ and $\mathrm{C}=\mathrm{C}$ double bond as the functional group. $\mathbf{n}$ is the number of Carbon atoms in the molecule. The carbon atoms are linked by at least one double bond to each other and single bonds to hydrogen atoms.
They include:

| n | General/ <br> Molecular <br> formula | Structural formula | Name |
| :--- | :--- | :--- | :--- |
| 1 |  | Does not exist | Ethene |
| 2 | $\mathrm{C}_{2} \mathrm{H}_{6}$ | $\mathrm{H}-\mathrm{C}=\mathrm{C}-\mathrm{H}$ |  |

|  |  | $\mathrm{CH}_{2} \mathrm{CH}_{2}$ |  |
| :---: | :---: | :---: | :---: |
| 3 | $\mathrm{C}_{3} \mathrm{H}_{8}$ |  | Propene |
| 4 | $\mathrm{C}_{4} \mathrm{H}_{10}$ |  | Butene |
| 5 | $\mathrm{C}_{5} \mathrm{H}_{12}$ |  | Pentene |
| 6 | $\mathrm{C}_{6} \mathrm{H}_{14}$ |  | Hexene |
| 7 | $\mathrm{C}_{7} \mathrm{H}_{16}$ |  | Heptene |

|  |  | $\mathrm{CH}_{2} \mathrm{CH}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{3}$ |  |
| :---: | :---: | :---: | :---: |
| 8 | $\mathrm{CH}_{8} \mathrm{H}_{18}$ |  | Octene |
| 9 | $\mathrm{C}_{9} \mathrm{H}_{20}$ |  | Nonene |
| 10 | $\mathrm{C}_{10} \mathrm{H}_{22}$ |  | decene |

## Note

1.Since carbon is tetravalent ,each atom of carbon in the alkene MUST always be bonded using four covalent bond /four shared pairs of electrons including at the double bond.
2.Since Hydrogen is monovalent ,each atom of hydrogen in the alkene MUST always be bonded using one covalent bond/one shared pair of electrons.
3.One member of the alkene, like alkanes,differ from the next/previous by a $\mathrm{CH}_{2}$ group. They also form a homologous series.
e.g

Propene differ from ethene by one carbon and two Hydrogen atoms from ethene.
4.A homologous series of alkenes like that of alkanes:
(i) differ by a $\mathrm{CH}_{2}$ group from the next /previous consecutively
(ii)have similar chemical properties
(iii)have similar chemical formula represented by the general formula $\mathrm{C}_{n} \mathrm{H}_{2 n}$ (iv)the physical properties also show steady gradual change
5.The $=\mathrm{C}=\mathrm{C}=$ double bond in alkene is the functional group. A functional group is the reacting site of a molecule/compound.
6. The $=\mathrm{C}=\mathrm{C}=$ double bond in alkene can easily be broken to accommodate more two more monovalent atoms. The $=\mathrm{C}=\mathrm{C}=$ double bond in alkenes make it thus unsaturated.
7. An unsaturated hydrocarbon is one with a double $=\mathrm{C}=\mathrm{C}=$ or triple $-\mathrm{C}=\mathrm{C}-$ carbon bonds in their molecular structure. Unsaturated hydrocarbon easily reacts to be saturated.
8. A saturated hydrocarbon is one without a double $=\mathrm{C}=\mathrm{C}=$ or triple $-\mathrm{C} \overline{\overline{ } \mathrm{C}}-$ carbon bonds in their molecular structure.
Most of the reactions of alkenes take place at the $=\mathrm{C}=\mathrm{C}=$ bond.

## (b)Isomers of alkenes

Isomers are alkenes lie alkanes have the same molecular general formula but different molecular structural formula.
Ethene and propene do not form isomers. Isomers of alkenes are also named by using the IUPAC(International Union of Pure and Applied Chemistry) system of nomenclature/naming.
The IUPAC system of nomenclature of naming alkenes uses the following basic rules/guidelines:
1.Identify the longest continuous/straight carbon chain which contains the $\mathbf{= C =} \mathbf{C =}$ double bond get/determine the parent alkene.
2.Number the longest chain form the end of the chain which contains the $=\mathbf{C}=\mathbf{C}=$ double bond so he $=\mathbf{C}=\mathbf{C}=$ double bond lowest number possible.
3 Indicate the positions by splitting "alk-positions-ene" e.g. but-2-ene, pent-1,3-diene.
4.The position indicated must be for the carbon atom at the lower position in the $=\mathbf{C}$ = $\mathbf{C}=$ double bond.i.e
But-2-ene means the double $=\mathrm{C}=\mathrm{C}=$ is between Carbon " 2 " and " 3 " Pent1,3 -diene means there are two double bond one between carbon " 1 " and " 2 " and another between carbon " 3 " and " 4 "
5. Determine the position, number and type of branches. Name them as methyl, ethyl, propyl e.tc. according to the number of alkyl carbon chains attached to the alkene. Name them fluoro-,chloro-,bromo-,iodo- if they are halogens
6.Use prefix di-,tri-,tetra-,penta-,hexa- to show the number of double $\mathrm{C}=\mathrm{C}$ bonds and branches attached to the alkene.
7.Position isomers can be formed when the $=\mathrm{C}=\mathrm{C}=$ double bond is shifted between carbon atoms e.g.
But-2-ene means the double $=\mathrm{C}=\mathrm{C}=$ is between Carbon " 2 " and " 3 "
But-1-ene means the double $=\mathrm{C}=\mathrm{C}=$ is between Carbon " 1 " and " 2 "
Both But-1-ene and But-2-ene are position isomers of Butene
8.Position isomers are molecules/compounds having the same general formular but different position of the functional group.i.e.
Butene has the molecular/general formular $\mathrm{C}_{4} \mathrm{H}_{8}$ position but can form both But-1ene and But-2-ene as position isomers.
9. Like alkanes ,an alkyl group can be attached to the alkene. Chain/branch isomers are thus formed.
10.Chain/branch isomers are molecules/compounds having the same general formula but different structural formula e.g
Butene and 2-methyl propene both have the same general formualr but different branching chain.

## Practice on IUPAC nomenclature of alkenes

Name the following isomers of alkene

But-1-ene

But-2-ene

H4-methylhex-1-ene

| 5. | 2,2-dimethylbut -2- ene |
| :---: | :---: |
| 8. $\mathrm{H}_{2} \mathrm{C} \mathrm{CHCH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ | pent -1- ene |
| 9. $\mathrm{H}_{2} \mathrm{C} \mathrm{C}\left(\mathrm{CH}_{3}\right) \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ | 2-methylpent-1- ene |
| 10. $\mathrm{H}_{2} \mathrm{C} \mathrm{C}\left(\mathrm{CH}_{3}\right) \mathrm{C}\left(\mathrm{CH}_{3}\right)_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ | 2,3,3-trimethylpent-1- ene |
| 11. $\mathrm{H}_{2} \mathrm{C} \mathrm{C}\left(\mathrm{CH}_{3}\right) \mathrm{C}\left(\mathrm{CH}_{3}\right)_{2} \mathrm{C}\left(\mathrm{CH}_{3}\right)_{2} \mathrm{CH}_{3}$ | 2,3,3,4,4-pentamethylpent -1- ene |
| 12. $\mathrm{H}_{3} \mathrm{C} \mathrm{C}\left(\mathrm{CH}_{3}\right) \mathrm{C}\left(\mathrm{CH}_{3}\right) \mathrm{C}\left(\mathrm{CH}_{3}\right)_{2} \mathrm{CH}_{3}$ | 2,3,4,4-tetramethylpent -2- ene |
| 13. $\mathrm{H}_{2} \mathrm{CCC}\left(\mathrm{CH}_{3}\right) \mathrm{C}\left(\mathrm{CH}_{3}\right) \mathrm{C}\left(\mathrm{CH}_{3}\right) \mathrm{CH}_{3}$ | 2,3,4-trimethylpent-1,3-diene |
| 14. $\mathrm{H}_{2} \mathrm{C} \mathrm{CBrCBr} \mathrm{CBr} \mathrm{CH} 3$ | 2,3,4-tribromopent-1,3-diene |
| 15. $\mathrm{H}_{2} \mathrm{C} \mathrm{CHCH} \mathrm{CH} 2$ | But -1,3-diene |
| 16. $\mathrm{Br}_{2} \mathrm{C} \mathrm{CBrCBr} \mathrm{CBr} 2$ | 1,1,2,3,4,4-hexabromobut -1,3- diene |
| 17. $\mathrm{I}_{2} \mathrm{C} \mathrm{CICI} \mathrm{CI} 2$ | 1,1,2,3,4,4-hexaiodobut -1,3-diene |
| 18. $\mathrm{H}_{2} \mathrm{C} \mathrm{C}\left(\mathrm{CH}_{3}\right) \mathrm{C}\left(\mathrm{CH}_{3}\right) \mathrm{CH}_{2}$ | 2,3-dimethylbut -1,3-diene |
| (c)Occurrence and extraction |  |

At indusrial level,alkenes are obtained from the cracking of alkanes.Cracking is the process of breaking long chain alkanes to smaller/shorter alkanes, an alkene and hydrogen gas at high temperatures.
Cracking is a major source of useful hydrogen gas for manufacture of ammonia/nitric(V)acid/HCl i.e.

Long chain alkane -> smaller/shorter alkane + Alkene + Hydrogen gas

## Examples

1.When irradiated with high energy radiation,Propane undergo cracking to form methane gas, ethene and hydrogen gas.
Chemical equation
$\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{3}(\mathrm{~g}) \quad->\mathrm{CH}_{4}(\mathrm{~g}) \quad+\mathrm{CH}_{2}=\mathrm{CH}_{2}(\mathrm{~g})+\mathrm{H}_{2}(\mathrm{~g})$
2.Octane undergo cracking to form hydrogen gas, butene and butane gases

Chemical equation
$\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{6} \mathrm{CH}_{3}(\mathrm{~g})->\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}(\mathrm{~g})+\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}=\mathrm{CH}_{2}(\mathrm{~g})+\mathrm{H}_{2}(\mathrm{~g})$

## (d)School laboratory preparation of alkenes

In a school laboratory, alkenes may be prepared from dehydration of alkanols using:
(i) concentrated sulphuric $(\mathrm{VI})$ acid $\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right)$.
(a) aluminium(III)oxide $\left(\mathrm{Al}_{2} \mathrm{O}_{3}\right)$ i.e

Alkanol --Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$--> Alkene + Water
Alkanol -- $\mathrm{Al}_{2} \mathrm{O}_{3}-->\quad$ Alkene $+\quad$ Water e.g.
1.(a)At about $180^{\circ} \mathrm{C}$,concentrated sulphuric(VI)acid dehydrates/removes water from ethanol to form ethene.
The gas produced contain traces of carbon(IV)oxide and sulphur(IV)oxide gas as impurities.
It is thus passed through concentrated sodium/potassium hydroxide solution to remove the impurities.
Chemical equation
$\mathrm{CH}_{3} \mathrm{CH}_{2} \mathbf{O H}$ (l) $\quad$--conc $\mathrm{H}_{2} \mathrm{SO}_{4} / 180^{\circ} \mathrm{C}$--> $\mathrm{CH}_{2}=\mathrm{CH}_{2}(\mathrm{~g}) \quad+\mathrm{H}_{2} \mathbf{O}(\mathrm{l})$
(b)On heating strongly aluminium(III)oxide $\left(\mathrm{Al}_{2} \mathrm{O}_{3}\right)$,it dehydrates/removes water from ethanol to form ethene.

Ethanol vapour passes through the hot aluminium (III) oxide which catalyses the dehydration.
Activated aluminium(III)oxide has a very high affinity for water molecules/elements of water and thus dehydrates/ removes water from ethanol to form ethene.

Chemical equation
$\mathrm{CH}_{3} \mathrm{CH}_{2} \mathbf{O H}(\mathrm{l}) \quad--\left(\mathrm{Al}_{2} \mathrm{O}_{3} /\right.$ strong heat--> $\mathrm{CH}_{2}=\mathrm{CH}_{2}(\mathrm{~g})+\mathbf{H}_{2} \mathbf{O}(\mathrm{l})$
2(a) Propan-1-ol and Propan-2-ol(position isomers of propanol) are dehydrated by conc $\mathrm{H}_{2} \mathrm{SO}_{4}$ at about $180^{\circ} \mathrm{C}$ to propene(propene has no position isomers).
Chemical equation
$\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{l}) \quad$-- conc $\mathrm{H}_{2} \mathrm{SO}_{4} / 180^{\circ} \mathrm{C}$--> $\mathrm{CH}_{3} \mathrm{CH}_{2}=\mathrm{CH}_{2}(\mathrm{~g})+\mathbf{H}_{2} \mathrm{O}(\mathrm{l})$
Propan-1-ol
Prop-1-ene
$\mathrm{CH}_{3} \mathrm{CHOHCH} 3$ (l) -- conc $\mathrm{H}_{2} \mathrm{SO}_{4} / 180^{\circ} \mathrm{C}$--> $\mathrm{CH}_{3} \mathrm{CH}_{2}=\mathrm{CH}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathbf{O}(\mathrm{l})$
Propan-2-ol
Prop-1-ene
(b) Propan-1-ol and Propan-2-ol(position isomers of propanol) are dehydrated by heating strongly aluminium(III)oxide $\left(\mathrm{Al}_{2} \mathrm{O}_{3}\right)$ form propene
Chemical equation
$\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{l}) \quad-$ Heat $/ \mathrm{Al}_{2} \mathrm{O}_{3}$--> $\mathrm{CH}_{3} \mathrm{CH}_{2}=\mathrm{CH}_{2}(\mathrm{~g}) \quad+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$

Laboratory set up for the preparation of alkenes/ethene

## Caution

(i)Ethanol is highly inflammable
(ii) Conc $\mathrm{H}_{2} \mathrm{SO}_{4}$ is highly corrosive on skin contact.
(iii)Common school thermometer has maximum calibration of $110^{\circ} \mathrm{C}$ and thus cannot be used. It breaks/cracks.

## (i)Using conentrated sulphuric(VI)acid

Some broken porcelain or sand should be put in the flask when heating to:
(i)prevent bumping which may break the flask.
(ii)ensure uniform and smooth boiling of the mixture

The temperatures should be maintained at above $160^{\circ} \mathrm{C}$.
At lower temperatures another compound -ether is predominantly formed instead of ethene gas.

## (ii)Using aluminium(III)oxide

## (e)Properties of alkenes <br> I. Physical properties

Like alkanes, alkenes are colourles gases, solids and liquids that are not poisonous. They are slightly soluble in water.
The solubility in water decrease as the carbon chain and as the molar mass increase but very soluble in organic solvents like tetrachloromethane and methylbenzene. The melting and boiling point increase as the carbon chain increase.
This is because of the increase in van-der-waals /intermolecular forces as the carbon chain increase.
The $1^{\text {st }}$ four straight chain alkenes (ethene,propane,but-1-ene and pent-1ene)are gases at room temperature and pressure.
The density of straight chain alkenes, like alkanes, increase with increasing carbon chain as the intermolecular forces increases reducing the volume occupied by a given mass of the alkene.

Summary of physical properties of the $1^{\text {st }}$ five alkenes

| Alkene | General <br> formula | Melting <br> point $\left({ }^{\circ} \mathrm{C}\right)$ | Boiling <br> point $(\mathrm{K})$ | State at room(298K) <br> temperature and pressure <br> atmosphere $(101300 \mathrm{~Pa})$ |
| :--- | :--- | :--- | :--- | :--- |

| Ethene | $\mathrm{CH}_{2} \mathrm{CH}_{2}$ | -169 | -104 | gas |
| :--- | :--- | :--- | :--- | :--- |

## II. Chemical properties <br> (a)Burning/combustion

Alkenes burn with a yellow/ luminous sooty/ smoky flame in excess air to form carbon(IV) oxide and water.
Alkene + Air $->\quad$ carbon(IV) oxide $+\quad$ water (excess air/oxygen)
Alkenes burn with a yellow/ luminous sooty/ smoky flame in limited air to form carbon(II) oxide and water.
Alkene + Air -> carbon(II) oxide + water (limited air)
Burning of alkenes with a yellow/ luminous sooty/ smoky flame is a confirmatory test for the presence of the $=\mathbf{C =} \mathbf{C}=$ double bond because they have higher $\mathbf{C}: \mathbf{H}$ ratio.
A homologous series with $-\stackrel{\mid}{\mathrm{C}}=\stackrel{\mid}{\mathrm{C}}-$ double or $-\mathrm{C} \equiv \mathrm{C}-$ triple bond is said to be unsaturated.
A homologous series with - $\mathrm{C}-\mathrm{C}-$ single bond is said to be saturated.Most of the reactions of the unsaturated compound involve trying to be saturated to form a

## Examples of burning alkenes

1.(a) Ethene when ignited burns with a yellow sooty flame in excess air to form carbon(IV) oxide and water.

| Ethene | + | Air | $->$ | carbon $(\mathbf{I V})$ oxide |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{C}_{2} \mathrm{H}_{4}(\mathrm{~g})$ | + | water (excess air/oxygen) |  |  |
| $3 \mathrm{O}_{2}(\mathrm{~g})$ | $->2 \mathrm{CO}_{2}(\mathrm{~g})$ | $+\quad 2 \mathrm{H}_{2} \mathrm{O}(1 / \mathrm{g})$ |  |  |

(b) Ethene when ignited burns with a yellow sooty flame in limited air to form carbon(II) oxide and water.

| Ethene | + | Air -> | carbon(II) oxide | (lin |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{C}_{2} \mathrm{H}_{4}(\mathrm{~g})$ |  | $3 \mathrm{O}_{2}(\mathrm{~g})$ | -> $2 \mathrm{CO}_{2}(\mathrm{~g})$ | $2 \mathrm{H}_{2} \mathrm{O}(1 / \mathrm{g})$ |

2.(a) Propene when ignited burns with a yellow sooty flame in excess air to form carbon(IV) oxide and water.

| Propene | + | Air | carbon $(\mathbf{I V})$ oxide | + |
| :--- | :--- | :--- | :--- | :--- |
| $2 \mathrm{C}_{3} \mathrm{H}_{6}(\mathrm{~g})$ | + | water (excess air/oxygen) |  |  |
| $9 \mathrm{O}_{2}(\mathrm{~g})$ | $->6 \mathrm{CO}_{2}(\mathrm{~g})$ | $+66 \mathrm{H}_{2} \mathrm{O}(1 / \mathrm{g})$ |  |  |

(a) Propene when ignited burns with a yellow sooty flame in limited air to form carbon(II) oxide and water.

## (b)Addition reactions

An addition reaction is one which an unsaturated compound reacts to form a saturated compound.Addition reactions of alkenes are named from the reagent used to cause the addtion/convert the double $=\mathrm{C}=\mathrm{C}=$ to single $\mathrm{C}-\mathrm{C}$ bond.

## (i)Hydrogenation

Hydrogenation is an addition reaction in which hydrogen in presence of
Palladium/Nickel catalyst at high temperatures react with alkenes to form alkanes. Examples
1.When Hydrogen gas is passed through liquid vegetable and animal oil at about $180^{\circ} \mathrm{C}$ in presence of Nickel catalyst,solid fat is formed.
Hydrogenation is thus used to harden oils to solid fat especially margarine. During hydrogenation, one hydrogen atom in the hydrogen molecule attach itself to one carbon and the other hydrogen to the second carbon breaking the double bond to single bond.

Chemical equation

$$
\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}_{2}+\mathrm{H}_{2}-\mathrm{Ni} / \mathrm{Pa}->\quad \mathrm{H}_{3} \mathrm{C}-\mathrm{CH}_{3}
$$

2.Propene undergo hydrogenation to form Propane

Chemical equation

3.Both But-1-ene and But-2-ene undergo hydrogenation to form Butane Chemical equation

But-1-ene + Hydrogen $-\mathrm{Ni} / \mathrm{Pa}->$ Butane
$\mathrm{H}_{3} \mathrm{C} \mathrm{CH}_{2} \mathrm{CH}=\mathrm{CH}_{2}+2-\mathrm{Ni} / \mathrm{Pa}->\mathrm{H}_{3} \mathrm{C} \mathrm{CH}_{2} \mathrm{CH}-\mathrm{CH}_{3}$

But-2-ene + Hydrogen $-\mathrm{Ni} / \mathrm{Pa}->$ Butane
$\mathrm{H}_{3} \mathrm{CCH}_{2}=\mathrm{CHCH}_{2}+\mathrm{H}_{2}-\mathrm{Ni} / \mathrm{Pa}->\mathrm{H}_{3} \mathrm{C} \mathrm{CH}_{2} \mathrm{CH}-\mathrm{CH}_{3}$

4. But-1,3-diene should undergo hydrogenation to form Butane. The reaction uses two moles of hydrogen molecules/four hydrogen atoms to break the two double bonds.

$$
\begin{array}{llll}
\text { But-1,3-diene } & + \text { Hydrogen-Ni/Pa-> Butane } \\
\mathrm{H}_{2} \mathrm{C} \mathrm{CH} \mathrm{CH}=\mathrm{CH}_{2} & +2 \mathrm{H}_{2} & \text {-Ni/Pa-> } \mathrm{H}_{3} \mathrm{C} \mathrm{CH}
\end{array}
$$

## (ii) Halogenation.

Halogenation is an addition reaction in which a halogen (Fluorine, chlorine, bromine, iodine) reacts with an alkene to form an alkane.
The double bond in the alkene break and form a single bond.
The colour of the halogen fades as the number of moles of the halogens remaining unreacted decreases/reduces.
One bromine atom bond at the $1^{\text {st }}$ carbon in the double bond while the other goes to the $2^{\text {nd }}$ carbon.

## Examples

1Ethene reacts with bromine to form 1,2-dibromoethane.
Chemical equation
$\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}_{2}+\mathrm{Br}_{2} \longrightarrow \mathrm{H}_{2} \mathrm{BrC}-\mathrm{CH}_{2} \mathrm{Br}$

2.Propene reacts with chlorine to form 1,2-dichloropropane.

Chemical equation

## H $\quad \mathrm{H} \quad \mathrm{H} \quad \mathrm{H}$

 H $\quad \mathrm{H} \quad \mathrm{H} \quad \mathrm{H}$3.Both But-1-ene and But-2-ene undergo halogenation with iodine to form 1,2diiodobutane and 2,3-diiodobutane
Chemical equation

But-2-ene + Iodine $\longrightarrow$ 2,3-diiodobutane
$\mathrm{H}_{3} \mathrm{C} \mathrm{CH}=\mathrm{CH}-\mathrm{CH}_{2}+\mathrm{F}_{2} \longrightarrow \mathrm{H}_{3} \mathrm{C} \mathrm{CHICHI}-\mathrm{CH}_{3}$

4. But-1,3-diene should undergo halogenation to form Butane. The reaction uses two moles of iodine molecules/four iodine atoms to break the two double bonds.

$$
\begin{array}{lll}
\text { But-1,3-diene } & + \text { iodine } \\
\mathrm{H}_{2} \mathrm{C}=\mathrm{CH} \mathrm{CH}=\mathrm{CH}_{2} & +2 \mathrm{I}_{2}
\end{array} \longrightarrow \begin{aligned}
& \text { 1,2,3,4-tetraiodobutane } \\
& \mathrm{H}_{2} \mathrm{CI} \text { CHICHI - CHI }
\end{aligned}
$$

(iii) Reaction with hydrogen halides.

Hydrogen halides reacts with alkene to form a halogenoalkane. The double bond in the alkene break and form a single bond.
The main compound is one which the hydrogen atom bond at the carbon with more hydrogen .
Examples

1. Ethene reacts with hydrogen bromide to form
bromoethane. Chemical equation

2. Propene reacts with hydrogen iodide to form 2-iodopropane.

## Chemical equation

3. Both But-1-ene and But-2-ene reacts with hydrogen bromide to form 2-bromobutane
Chemical equation
But-1-ene + hydrogen bromide $\longrightarrow$ 2-bromobutane
$\mathrm{H}_{3} \mathrm{CCH}_{2} \mathrm{CH}=\mathrm{CH}_{2}+\mathrm{HBr} \longrightarrow \mathrm{H}_{3} \mathrm{C} \mathrm{CH}_{2} \mathrm{CHBr}_{-} \mathrm{CH}_{3}$

But-2-ene + Hydrogen bromide $\longrightarrow$ 2-bromobutane $\mathrm{H}_{3} \mathrm{CCH}=\mathrm{CH}-\mathrm{CH}_{2}+\mathrm{HBr} \longrightarrow \mathrm{H}_{3} \mathrm{C} \mathrm{CHBrCH}_{2}-\mathrm{CH}_{3}$

4. But-1,3-diene react with hydrogen iodide to form 2,3- diiodobutane. The reaction uses two moles of hydrogen iodide molecules/two iodine atoms and two hydrogen atoms to break the two double bonds.

But-1,3-diene + iodine $\longrightarrow$ 2,3-diiodobutane

## (iv) Reaction with bromine/chlorine water.

Chlorine and bromine water is formed when the halogen is dissolved in distilled water.Chlorine water has the formular $\mathrm{HOCl}($ hypochlorous/chloric(I)acid) .Bromine water has the formular $\mathrm{HOBr}($ hydrobromic(I)acid).
During the addition reaction the halogen move to one carbon and the OH to the other carbon in the alkene at the $=\mathrm{C}=\mathrm{C}=$ double bond to form a halogenoalkanol.

Bromine water + Alkene -> bromoalkanol
Chlorine water + Alkene -> bromoalkanol

## Examples

1Ethene reacts with bromine water to form bromoethanol.
Chemical equation
$\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}_{2}+\mathrm{HOBr} \longrightarrow \mathrm{H}_{2} \mathrm{BrC}-\mathrm{CH}_{2} \mathrm{OH}$

2.Propene reacts with chlorine water to form chloropropan-2-ol / 2-chloropropan-1ol.
Chemical equation

$$
\begin{aligned}
& \text { H } \\
& \mathrm{H}_{3} \mathrm{C} \text { CHOH }-\mathrm{CH}_{2} \mathrm{Cl} \\
& \underset{\text { Propene }}{\text { II. } \mathrm{H}_{3} \mathrm{C} \mathrm{CH}=\mathrm{CH}_{2}}+\underset{\text { Chlorine }}{+} \xrightarrow{\mathrm{HOCl}} \longrightarrow \\
& \text { chloropropan-2-ol }
\end{aligned}
$$

3.Both But-1-ene and But-2-ene react with bromine water to form 2-bromobutan-1ol /3-bromobutan-2-ol respectively

Chemical equation
I.But-1-ene + bromine water

2-hromobutan-1-ol
$\mathrm{H}_{3} \mathrm{CCH}_{2} \mathrm{CH}=\mathrm{CH}_{2}+\mathrm{HOBr} \longrightarrow \mathrm{H}_{3} \mathrm{C} \mathrm{CH}_{2} \mathrm{CH} \mathrm{Br}-\mathrm{CH}_{2} \mathrm{OH}$

$\begin{array}{ll}\text { II.But-2-ene } & + \text { bromine water } \longrightarrow \mathrm{H}_{3} \mathrm{C} \mathrm{CH}_{2} \mathrm{OHCH}^{2} \\ \mathrm{H}_{3} \mathrm{C} \mathrm{CH}=\mathrm{CHCH}_{3}\end{array}$ 3-bromobutan-2-ol

4. But-1,3-diene reacts with bromine water to form Butan-1,3-diol.

The reaction uses two moles of bromine water molecules to break the two double bonds.

$$
\begin{aligned}
& \text { But-1,3-diene }+ \text { bromine water } \longrightarrow \\
& \begin{array}{l}
\mathrm{H}_{2} \mathrm{C}=\mathrm{CH} \mathrm{CH}=\mathrm{CH}_{2} \\
\mathrm{HHHH} \\
\text { H }
\end{array} \text { 2,4-dibromobutan-1,3-diol } \\
& \mathrm{H}_{2} \mathrm{COH} \mathrm{CHBrCHOH} \mathrm{CHBr} \\
& \hline
\end{aligned}
$$

## (v) Oxidation.

Alkenes are oxidized to alkanols with duo/double functional groups by oxidizing agents.
When an alkene is bubbled into orange acidified potassium/sodium dichromate (VI) solution,the colour of the oxidizing agent changes to green.

When an alkene is bubbled into purple acidified potassium/sodium manganate(VII) solution, the oxidizing agent is decolorized.
Examples
1Ethene is oxidized to ethan-1,2-diol by acidified potassium/sodium manganate(VII) solution/ acidified potassium/sodium dichromate(VI) solution.
The purple acidified potassium/sodium manganate(VII) solution is decolorized.
The orange acidified potassium/sodium dichromate(VI) solution turns to green.
Chemical equation
$\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}_{2} \longrightarrow[\mathrm{O}]$ in $\mathrm{H}+/ \mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7} \longrightarrow \mathrm{HO} \mathrm{CH}_{2}-\mathrm{CH}_{2} \mathrm{OH}$

2. Propene is oxidized to propan-1,2-diol by acidified potassium/sodium manganate(VII) solution/ acidified potassium/sodium dichromate(VI) solution. The purple acidified potassium/sodium manganate(VII) solution is decolorized. The orange acidified potassium/sodium dichromate(VI) solution turns to green. Chemical equation

3.Both But-1-ene and But-2-ene react with bromine water to form butan-1,2-diol and butan-2,3-diol

Chemical equation

$\mathrm{H}_{3} \mathrm{CCH}_{2} \mathrm{CH}=\mathrm{CH}_{2}+[\mathrm{O}]$
$\longrightarrow \mathrm{H}_{3} \mathrm{C} \mathrm{CH}_{2} \mathrm{CHOH}-\mathrm{CH}_{2} \mathrm{OH}$

## (v) Hydrolysis.

Hydrolysis is the reaction of a compound with water/addition of $\mathrm{H}-\mathrm{OH}$ to a compound.
Alkenes undergo hydrolysis to form alkanols .
This takes place in two steps:
(i)Alkenes react with concentrated sulphuric(VI)acid at room temperature and pressure to form alkylhydrogen sulphate(VI).

Alkenes + concentrated sulphuric(VI)acid -> alkylhydrogen sulphate(VI)
(ii)On adding water to alkylhydrogen sulphate(VI) then warming, an alkanol is formed.
alkylhydrogen sulphate(VI) + water -warm-> Alkanol.
Examples
(i)Ethene reacts with cold concentrated sulphuric(VI)acid to form ethyl hydrogen sulphate(VII)
Chemical equation

H H
Ethene $\quad+\quad \mathrm{H}_{2} \mathrm{SO}_{4}$

H H
ethylhydrogen sulphate(VI)
(ii) Ethylhydrogen sulphate(VI) is hydrolysed by water to ethanol Chemical equation
$\mathrm{CH}_{3}-\mathrm{CH}_{2} \mathrm{OSO}_{3} \mathrm{H}+\mathrm{H}_{2} \mathrm{O} \longrightarrow \mathrm{CH}_{3}-\mathrm{CH}_{2} \mathrm{OH}+\mathrm{H}_{2} \mathrm{SO}_{4}$

ethylhydrogen sulphate $(\mathrm{VI})+\mathrm{H}_{2} \mathrm{O} \longrightarrow$ Ethanol
2. Propene reacts with cold concentrated sulphuric(VI)acid to form propyl hydrogen sulphate(VII)
Chemical equation
$\mathrm{CH}_{3} \mathrm{H}_{2} \mathrm{C}=\mathrm{CH}_{2} \quad+\mathrm{H}_{2} \mathrm{SO}_{4} \quad \longrightarrow \quad \mathrm{CH}_{3} \mathrm{CH}_{2}-\mathrm{CH}_{2} \mathrm{OSO}_{3} \mathrm{H}$

Propene $+\mathrm{H}_{2} \mathrm{SO}_{4} \longrightarrow$ propylhydrogen sulphate(VI)
(ii) Propylhydrogen sulphate(VI) is hydrolysed by water to propanol

## Chemical equation

(vi) Polymerization/self addition

Addition polymerization is the process where a small unsaturated monomer (alkene ) molecule join together to form a large saturated molecule.

## Only alkenes undergo addition polymerization.

Addition polymers are named from the alkene/monomer making the polymer and adding the prefix "poly" before the name of monomer to form a polyalkene

During addition polymerization
(i)the double bond in alkenes break
(ii)free radicals are formed
(iii)the free radicals collide with each other and join to form a larger molecule. The more collisions the larger the molecule.

## Examples of addition polymerization

## 1.Formation of Polyethene

Polyethene is an addition polymer formed when ethene molecule/monomer join together to form a large molecule/polymer at high temperatures and pressure. During polymerization:
(i)many molecules are brought nearer to each other by the high pressure(which reduces the volume occupied by reacting paticles)
Ethene $+{ }_{-}^{C}$
(ii)the double bond joining the ethane molecule break to free readicals

Ethene radical + Ethene radical + Ethene radical + Ethene radical + ...
(iii)the free radicals collide with each other and join to form a larger molecule

Lone pair of electrons can be used to join more monomers to form longer polyethene.
Polyethene molecule can be represented as:

HНННННH Since the molecule is a repetition

Where $\mathbf{n}$ is the number of monomers in the polymer. The number of monomers in the polymer can be determined from the molar mass of the polymer and monomer from the relationship:
Number of monomers/repeating units in monomer $=$ Molar mass polymer
Molar mass monomer

## Examples

Polythene has a molar mass of 4760 . Calculate the number of ethene molecules in the polymer( $\mathrm{C}=\mathbf{1 2 . 0}, \mathrm{H}=1.0$ )

Number of monomers/repeating units in polyomer $=\underline{\text { Molar mass polymer }}$
Molar mass monomer
=> Molar mass ethene $\left(\mathrm{C}_{2} \mathrm{H}_{4}\right)=28$ Molar mass polyethene $=4760$
Substituting $\quad \frac{4760}{28} \quad=\quad \underline{170 \text { ethene molecules }}$
The commercial name of polyethene is polythene.

It is an elastic, tough, transparent and durable plastic.
Polythene is used:
(i)in making plastic bag
(ii)bowls and plastic bags
(iii)packaging materials

## 2.Formation of Polychlorethene

Polychloroethene is an addition polymer formed when chloroethene molecule/monomer join together to form a large molecule/polymer at high temperatures and pressure.
During polymerization:
(i)many molecules are brought nearer to each other by the high pressure(which reduces the volume occupied by reacting particles)

chloroethene + chloroethene + chloroethene + chloroethene $+\ldots$
(ii)the double bond joining the chloroethene molecule break to free radicals

(iii)the free radicals collide with each other and join to form a larger molecule

Lone pair of electrons can be used to join more monomers to form longer polychloroethene.
Polychloroethene molecule can be represented as:

Since the molecule is a repetition of one monomer, then the polymer is:

## Examples

Polychlorothene has a molar mass of $\mathbf{4 7 6 0}$. Calculate the number of chlorethene molecules in the $\operatorname{polymer}(\mathrm{C}=12.0, \mathrm{H}=1.0, \mathrm{Cl}=35.5$ )

Number of monomers/repeating units in monomer $=$ Molar mass polymer
Molar mass monomer
$\Rightarrow$ Molar mass ethene $\left(\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{Cl}\right)=62.5$ Molar mass polyethene $=4760$
Substituting $\underline{4760}=\underline{77.16} \Rightarrow>\underline{77}$ polychloroethene molecules(whole number) 62.5

The commercial name of polychloroethene is polyvinylchloride(PVC). It is a tough, non-transparent and durable plastic. PVC is used:
(i)in making plastic rope
(ii)water pipes
(iii)crates and boxes
3.Formation of Polyphenylethene

Polyphenylethene is an addition polymer formed when phenylethene molecule/monomer join together to form a large molecule/polymer at high temperatures and pressure.
During polymerization:
(i)many molecules are brought nearer to each other by the high pressure(which reduces the volume occupied by reacting particles)

phenylethene + phenylethene + phenylethene + phenylethene + ...
(ii)the double bond joining the phenylethene molecule break to free radicals

(iii)the free radicals collide with each other and join to form a larger molecule

Lone pair of electrons can be used to join more monomers to form longer polyphenylethene.
Polyphenylethene molecule can be represented as:

Since the molecule is a repetition of one monomer, then the polymer is:

Examples

## Polyphenylthene has a molar mass of 4760.Calculate the number of phenylethene molecules in the polymer( $\mathrm{C}=12.0, \mathrm{H}=1.0$, )

Number of monomers/repeating units in monomer $=\underline{\text { Molar mass polymer }}$
Molar mass monomer
=> Molar mass ethene $\left(\mathrm{C}_{8} \mathrm{H}_{8}\right)=104$ Molar mass polyethene $=4760$
Substituting $\underline{4760}=\underline{45.7692}=>\underline{45}$ polyphenylethene molecules(whole number) 104

The commercial name of polyphenylethene is polystyrene. It is a very light durable plastic. Polystyrene is used:
(i)in making packaging material for carrying delicate items like computers, radion,calculators.
(ii)ceiling tiles
(iii)clothe linings

## 4.Formation of Polypropene

Polypropene is an addition polymer formed when propene molecule/monomer join together to form a large molecule/polymer at high temperatures and pressure.

During polymerization:
(i)many molecules are brought nearer to each other by the high pressure(which reduces the volume occupied by reacting particles)

(ii)the double bond joining the phenylethene molecule break to free radicals

(iii)the free radicals collide with each other and join to form a larger molecule

Lone pair of electrons can be used to join more monomers to form longer propene. propene molecule can be represented as:

Since the molecule is a repetition of one monomer, then the polymer is:

## Examples

Polypropene has a molar mass of 4760. Calculate the number of propene molecules in the polymer( $\mathrm{C}=12.0, \mathrm{H}=1.0$, )

Number of monomers/repeating units in monomer $=\underline{\text { Molar mass polymer }}$
Molar mass monomer
=> Molar mass propene $\left(\mathrm{C}_{3} \mathrm{H}_{8}\right)=44$ Molar mass polyethene $=4760$
Substituting $\underline{4760}=\underline{108.1818}=>\underline{108}$ propene molecules $(\boldsymbol{w h o l e}$ number) 44
The commercial name of polyphenylethene is polystyrene. It is a very light durable plastic. Polystyrene is used:
(i)in making packaging material for carrying delicate items like computers, radion,calculators.
(ii)ceiling tiles
(iii)clothe linings
5.Formation of Polytetrafluorothene

Polytetrafluorothene is an addition polymer formed when tetrafluoroethene molecule/monomer join together to form a large molecule/polymer at high temperatures and pressure.
During polymerization:
(i)many molecules are brought nearer to each other by the high pressure(which reduces the volume occupied by reacting particles)

tetrafluoroethene + tetrafluoroethene+ tetrafluoroethene + tetrafluoroethene $+\ldots$
(ii)the double bond joining the tetrafluoroethene molecule break to free radicals

(iii)the free radicals collide with each other and join to form a larger molecule

Lone pair of electrons can be used to join more monomers to form longer polytetrafluoroethene.
polytetrafluoroethene molecule can be represented as:

FFFFFFFF

Since the molecule is a repetition of one monomer, then the polymer is:

## Examples

Polytetrafluorothene has a molar mass of 4760.Calculate the number of tetrafluoroethene molecules in the polymer( $\mathrm{C}=12.0, \mathrm{~F}=19$ )
Number of monomers/repeating units in monomer $=$ Molar mass polymer
Molar mass monomer
=> Molar mass ethene $\left(\mathrm{C}_{2} \mathrm{~F}_{4}\right)=62.5$ Molar mass polyethene $=4760$
Substituting $\frac{4760}{62.5}=\underline{77.16}=>\underline{77 \text { polychloroethene molecules(whole number) }}$
The commercial name of polytetrafluorethene(P.T.F.E) is Teflon(P.T.F.E). It is a tough, non-transparent and durable plastic. PVC is used:
(i)in making plastic rope
(ii)water pipes
(iii)crates and boxes

## 6.Formation of rubber from Latex

Natural rubber is obtained from rubber trees.
During harvesting an incision is made on the rubber tree to produce a milky white substance called latex.
Latex is a mixture of rubber and lots of water.
The latex is then added an acid to coagulate the rubber.
Natural rubber is a polymer of 2-methylbut-1,3-diene ;
$\mathrm{CH}_{2}=\mathrm{C}\left(\mathrm{CH}_{3}\right) \mathrm{CH}=\mathrm{CH}_{2} \quad \mathrm{H}-\mathrm{C}=\mathrm{C}-\mathrm{C}=\mathrm{C}-\mathrm{H}$
During natural polymerization to rubber, one double $\mathrm{C}=\mathrm{C}$ bond break to self add to another molecule.The double bond remaining move to carbon " 2 " thus;

Generally the structure of rubber is thus;

Pure rubber is soft and sticky.It is used to make erasers, car tyres. Most of it is vulcanized.Vulcanization is the process of heating rubber with sulphur to make it harder/tougher.
During vulcanization the sulphur atoms form a cross link between chains of rubber molecules/polymers. This decreases the number of $\mathrm{C}=\mathrm{C}$ double bonds in the polymer.

Vulcanized rubber is used to make tyres, shoes and valves.

## 7.Formation of synthetic rubber

Synthetic rubber is able to resist action of oil,abrasion and organic solvents which rubber cannot.
Common synthetic rubber is a polymer of 2-chlorobut-1,3-diene ;

$\mathrm{CH}_{2}=\mathrm{C}\left(\mathrm{Cl} \mathrm{CH}=\mathrm{CH}_{2} \quad \mathrm{H}-\mathrm{C}=\mathrm{C}-\mathrm{C}=\mathrm{C}-\mathrm{H}\right.$

During polymerization to synthetic rubber, one double $\mathrm{C}=\mathrm{C}$ bond is broken to self add to another molecule. The double bond remaining move to carbon " 2 " thus;

Generally the structure of rubber is thus;

Rubber is thus strengthened through vulcanization and manufacture of synthetic rubber.
(c) Test for the presence of $-\mathbf{d}=\mathbf{C}$ - double bond.
(i)Burning/combustion

1 I
All unsaturated hydrocarbons with a $-\mathbf{C}=\mathbf{C}-$ or $-\mathbf{C}=\mathbf{C}-$ bond burn with a yellow sooty flame.

## Experiment

Scoop a sample of the substance provided in a clean metallic spatula. Introduce it on a Bunsen burner.

| Observation | Inference |
| :--- | :--- |
| Solid melt then burns with a <br> yellow sooty flame | $-\mathbf{C}=\mathbf{C}-$, |
|  | $-\mathbf{C} \equiv \mathbf{C}$ - bond |

(ii)Oxidation by acidified $\mathrm{KMnO}_{4} / \mathrm{K}_{\mathbf{2}} \mathrm{Cr}_{2} \mathrm{O}_{7}$

Bromine water ,Chlorine water and Oxidizing agents acidified $\mathrm{KMnO}_{4} / \mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ change to unique colour in presence of $-\mathbf{C}=\mathbf{C}-$
or $-\mathbf{C}=\mathbf{C}$ - bond.

## Experiment

Scoop a sample of the substance provided into a clean test tube. Add 10 cm 3 of distilled water. Shake. Take a portion of the solution mixture. Add three drops of acidified $\mathrm{KMnO}_{4} / \mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$.

| Observation | Inference |
| :--- | :--- |
| Acidified $\mathrm{KMnO}_{4}$ decolorized | $-\mathbf{C}_{\mathbf{1}}=\mathbf{C}_{-\mathbf{1}}$ |
| Orange colour of acidified $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ turns | $-\mathbf{C} \equiv \mathbf{C}$ - bond |
| green |  |
| Bromine water is decolorized |  |
| Chlorine water is decolorized |  |

## (d)Some uses of Alkenes

1. In the manufacture of plastic
2. Hydrolysis of ethene is used in industrial manufacture of ethanol.
3. In ripening of fruits.
4. In the manufacture of detergents.

## (iii) Alkynes

## (a)Nomenclature/Naming

These are hydrocarbons with a general formula $\mathrm{C}_{\mathrm{n}} \mathrm{H}_{2 n-2}$ and $\mathrm{C}=\overline{\overline{\mathrm{C}} \text { double bond }}$ as the functional group . $\mathbf{n}$ is the number of Carbon atoms in the molecule. The carbon atoms are linked by at least one triple bond to each other and single bonds to hydrogen atoms.

They include:

| n | General/ <br> formula | uctural formula Name Molecular |  |
| :---: | :---: | :---: | :---: |
| 1 |  | Does not exist | - |
| 2 | $\mathrm{C}_{2} \mathrm{H}_{2}$ | $\mathrm{H}-\mathrm{C} \underset{\mathrm{CH} \mathrm{CH}}{=} \mathrm{C}-\mathrm{H}$ | Ethyne |
| 3 | $\mathrm{C}_{3} \mathrm{H}_{4}$ |  | Propyne |
| 4 | $\mathrm{C}_{4} \mathrm{H}_{6}$ |  | Butyne |
| 5 | $\mathrm{C}_{5} \mathrm{H}_{8}$ |  | Pentyne |
| 6 | $\mathrm{C}_{6} \mathrm{H}_{10}$ | H H H H | Hexyne |
| - $\left\|1{ }_{50}\right\|$ |  |  |  |

|  |  <br> $\mathrm{CHC}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}_{3}$ |
| :---: | :---: |

| 7 | $\mathrm{CH}_{72}$ |  <br> $\mathrm{CHC}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{3}$ | Heptyne |
| :---: | :---: | :---: | :---: |
| 8 | $\mathrm{CH}_{8} \mathrm{H}_{14}$ |  <br> $\mathrm{CH} \mathrm{C}\left(\mathrm{CH}_{2}\right)_{5} \mathrm{CH}_{3}$ | Octyne |
| 9 | $\mathrm{C}_{9} \mathrm{H}_{16}$ |  <br> $\mathrm{CH} \mathrm{C}\left(\mathrm{CH}_{2}\right)_{6} \mathrm{CH}_{3}$ | Nonyne |
| 10 | $\mathrm{C}_{10} \mathrm{H}_{18}$ |  <br> $\mathrm{CHC}\left(\mathrm{CH}_{2}\right)_{7} \mathrm{CH}_{3}$ | Decyne |

## Note

1. Since carbon is tetravalent ,each atom of carbon in the alkyne MUST always be bonded using four covalent bond /four shared pairs of electrons including at the triple bond.
2. Since Hydrogen is monovalent, each atom of hydrogen in the alkyne MUST always be bonded using one covalent bond/one shared pair of electrons.
3. One member of the alkyne ,like alkenes and alkanes, differ from the next/previous by a $\mathrm{CH}_{2}$ group(molar mass of 14 atomic mass units). They thus form a homologous series.

Propyne differ from ethyne by (14 a.m.u) one carbon and two Hydrogen atoms from ethyne.
4.A homologous series of alkenes like that of alkanes:
(i) differ by a $\mathrm{CH}_{2}$ group from the next/previous consecutively
(ii) have similar chemical properties
(iii)have similar chemical formula with general formula $\mathrm{C}_{\mathrm{n}} \mathrm{H}_{2 \mathrm{n}}$ 2 (iv)the physical properties also show steady gradual change
5.The - C $\#$ C - triple bond in alkyne is the functional group. The functional group is the reacting site of the alkynes.
6. The - $\mathrm{C}=\mathrm{C}$ - triple bond in alkyne can easily be broken to accommodate more /four more monovalent atoms. The - $\mathrm{C}=\overline{\mathrm{C}}$ - triple bond in alkynes make it thus unsaturated like alkenes.
7. Most of the reactions of alkynes like alkenes take place at the - C § C - triple bond.

## (b)Isomers of alkynes

Isomers of alkynes have the same molecular general formula but different molecular structural formula.
Isomers of alkynes are also named by using the IUPAC(International Union of Pure and Applied Chemistry) system of nomenclature/naming.
The IUPAC system of nomenclature of naming alkynes uses the following basic rules/guidelines:
1.Identify the longest continuous/straight carbon chain which contains the - $\mathbf{C}=\mathbf{C}$ triple bond to get/determine the parent alkene.
2. Number the longest chain form the end of the chain which contains the - $\mathbf{C}=\mathbf{C}$ triple bond so as - C C- triple bond get lowest number possible.

3 Indicate the positions by splitting "alk-positions-yne" e.g. but-2-yne, pent-1,3-diyne.
4.The position indicated must be for the carbon atom at the lower position in the -C $\equiv \mathbf{C}$ - triple bond. i.e
But-2-yne means the triple - $\mathrm{C} \equiv \mathrm{C}$ - is between Carbon " 2 " and " 3 " Pent-1,3diyne means there are two triple bonds; one between carbon " 1 " and " 2 "and another between carbon " 3 " and " 4 "
5. Determine the position, number and type of branches. Name them as methyl, ethyl, propyl e.tc. according to the number of alkyl carbon chains attached to the alkyne. Name them fluoro-,chloro-,bromo-,iodo- if they are halogens
6.Use prefix di-,tri-,tetra-,penta-,hexa- to show the number of triple - $\mathrm{C}=\overline{\mathrm{C}}$ bonds and branches attached to the alkyne.
7.Position isomers can be formed when the - $\mathrm{C}=\mathrm{C}$ - triple bond is shifted between carbon atoms e.g.
But-2-yne means the double - $\mathrm{C}=\mathrm{C}$ - is between Carbon " 2 " and " 3 "
But-1-yne means the double - $\mathrm{C}=\mathrm{C}$ - is between Carbon " 1 " and " 2 "
Both But-1-yne and But-2-yne are position isomers of Butyne.
9. Like alkanes and alkynes, an alkyl group can be attached to the alkyne. Chain/branch isomers are thus formed.
Butyne and 2-methyl propyne both have the same general formular but different branching chain.

## (More on powerpoint)

## (c)Preparation of Alkynes.

Ethyne is prepared from the reaction of water on calcium carbide. The reaction is highly exothermic and thus a layer of sand should be put above the calcium carbide to absorb excess heat to prevent the reaction flask from breaking. Copper(II)sulphate(VI) is used to catalyze the reaction

## Chemical equation

$$
\mathrm{CaC}_{2}(\mathrm{~s})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})->\mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{aq})+\mathrm{C}_{2} \mathrm{H}_{2}(\mathrm{~g})
$$

## (d)Properties of alkynes

## I. Physical properties

Like alkanes and alkenes, alkynes are colourles gases, solids and liquids that are not poisonous.
They are slightly soluble in water. The solubility in water decrease as the carbon chain and as the molar mass increase but very soluble in organic solvents like tetrachloromethane and methylbenzene. Ethyne has a pleasant taste when pure. The melting and boiling point increase as the carbon chain increase.
This is because of the increase in van-der-waals /intermolecular forces as the carbon chain increase. The $1^{\text {st }}$ three straight chain alkynes (ethyne, propyne and but-1yne)are gases at room temperature and pressure.
The density of straight chain alkynes increase with increasing carbon chain as the intermolecular forces increases reducing the volume occupied by a given mass of the alkyne.

Summary of physical properties of the $1^{\text {st }}$ five alkenes

| Alkyne | General formula | Melting <br> point $\left({ }^{\circ} \mathrm{C}\right)$ | Boiling <br> point $\left({ }^{\circ} \mathrm{C}\right)$ | State at room(298K) <br> temperature and <br> pressure atmosphere <br> $(101300 \mathrm{~Pa})$ |
| :--- | :--- | :--- | :--- | :--- |
| Ethyne | CH CH | -82 | -84 | gas |
| Propyne | $\mathrm{CH}_{3} \mathrm{C} \mathrm{CH}$ | -103 | -23 | gas |
| Butyne | $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CCH}$ | -122 | 8 | gas |
| Pent-1-yne | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CCH}$ | -119 | 39 | liquid |
| Hex-1-yne | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{C}$ <br> CH | -132 | 71 | liquid |

## II. Chemical properties <br> (a)Burning/combustion

Alkynes burn with a yellow/ luminous very sooty/ smoky flame in excess air to form carbon(IV) oxide and water.
Alkyne + Air $->\quad$ carbon(IV) oxide $+\quad$ water (excess air/oxygen)
Alkenes burn with a yellow/ luminous verysooty/ smoky flame in limited air to form carbon(II) oxide/carbon and water.

Alkyne + Air -> carbon(II) oxide /carbon + water (limited air) Burning of alkynes with a yellow/ luminous sooty/ smoky flame is a confirmatory test for the presence of the - $\mathbf{C}=\mathbf{C}$ - triple bond because they have very high

## C:H ratio.

## Examples of burning alkynes

1.(a) Ethyne when ignited burns with a yellow very sooty flame in excess air to form carbon(IV) oxide and water.

| Ethyne + Air $->2 \mathrm{C}_{2} \mathrm{H}_{2}(\mathrm{~g})+$ | carbon $(\mathbf{I V})$ oxide + | water (excess air/oxygen) |
| :--- | :--- | :--- |
| $5 \mathrm{O}_{2}(\mathrm{~g})$ |  |  |$\quad+4 \mathrm{CO}_{2}(\mathrm{~g}) \quad+2 \mathrm{H}_{2} \mathrm{O}(1 / \mathrm{g})$

(b) Ethyne when ignited burns with a yellow sooty flame in limited air to form a mixture of unburnt carbon and carbon(II) oxide and water.
Ethyne + Air $\quad>\quad$ carbon(II) oxide $+\quad$ water (limited air)
$\mathrm{C}_{2} \mathrm{H}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g})->\quad 2 \mathrm{CO}_{2}(\mathrm{~g})+\mathrm{C}+2 \mathrm{H}_{2} \mathrm{O}(1 / \mathrm{g})$
2.(a) Propyne when ignited burns with a yellow sooty flame in excess air to form carbon(IV) oxide and water.

| Propyne | + | Air | carbon(IV) oxide | + |
| :---: | :--- | :--- | :--- | :--- |
| $\mathrm{C}_{3} \mathrm{H}_{4}(\mathrm{~g})$ | $+4 \mathrm{O}_{2}(\mathrm{~g})$ | $->3 \mathrm{CO}_{2}(\mathrm{~g})$ |  | water (excess air/oxygen) |

(a) Propyne when ignited burns with a yellow sooty flame in limited air to form carbon(II) oxide and water.

| Propene | + | Air | carbon (IV) oxide | + | water (excess air/oxygen) |
| :---: | :--- | :--- | :--- | :--- | :--- |
| $2 \mathrm{C}_{3} \mathrm{H}_{4}(\mathrm{~g})$ | + | $5 \mathrm{O}_{2}(\mathrm{~g})$ | $->\quad 6 \mathrm{CO}(\mathrm{g})$ | $+\quad 4 \mathrm{H}_{2} \mathrm{O}(1 / \mathrm{g})$ |  |

## (b)Addition reactions

An addition reaction is one which an unsaturated compound reacts to form a saturated compound. Addition reactions of alkynes are also named from the reagent used to cause the addition/convert the triple - $\mathrm{C}=\mathrm{C}$ - to single $\mathrm{C}-\mathrm{C}$ bond.

## (i)Hydrogenation

Hydrogenation is an addition reaction in which hydrogen in presence of
Palladium/Nickel catalyst at $150^{\circ} \mathrm{C}$ temperatures react with alkynes to form alkenes then alkanes.

## Examples

1.During hydrogenation, two hydrogen atom in the hydrogen molecule attach itself to one carbon and the other two hydrogen to the second carbon breaking the triple bond to double the single.
Chemical equation

$$
\mathrm{HC} \equiv \mathrm{CH}+\mathrm{H}_{2} \quad-\mathrm{Ni} / \mathrm{Pa}->\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}_{2}+\mathrm{H}_{2} \quad-\mathrm{Ni} / \mathrm{Pa}->\mathrm{H}_{2} \mathrm{C}-\mathrm{CH}_{2}
$$

2.Propyne undergo hydrogenation to form Propane

Chemical equation
$\mathrm{H}_{3} \mathrm{CCH}$ - $\mathrm{CH}_{2}+2 \mathrm{H}_{2}-\mathrm{Ni} / \mathrm{Pa}->\mathrm{H}_{3} \mathrm{CCH}-\mathrm{CH}_{3}$

3(a) But-1-yne undergo hydrogenation to form Butane Chemical equation

But-1-yne + Hydrogen -Ni/Pa-> Butane
$\mathrm{H}_{3} \mathrm{CCH}_{2} \mathrm{C}=\mathrm{CH}+2 \mathrm{H}_{2}-\mathrm{Ni} / \mathrm{Pa}->\mathrm{H}_{3} \mathrm{CCH}_{2} \mathrm{CH}-\mathrm{CH}_{3}$

(b) But-2-yne undergo hydrogenation to form Butane Chemical equation

But-2-yne + Hydrogen $-\mathrm{Ni} / \mathrm{Pa}->$ Butane
$\mathrm{H}_{3} \mathrm{CC}=\overline{\mathrm{C}} \mathrm{CH}_{2}+2 \mathrm{H}_{2}-\mathrm{Ni} / \mathrm{Pa}->\mathrm{H}_{3} \mathrm{CCH}_{2} \mathrm{CH}-\mathrm{CH}_{3}$

## (ii) Halogenation.

Halogenation is an addition reaction in which a halogen (Fluorine, chlorine, bromine, iodine) reacts with an alkyne to form an alkene then alkane.
The reaction of alkynes with halogens with alkynes is faster than with alkenes. The triple bond in the alkyne break and form a double then single bond.
The colour of the halogen fades as the number of moles of the halogens remaining unreacted decreases.
Two bromine atoms bond at the $1^{\text {st }}$ carbon in the triple bond while the other two goes to the $2^{\text {nd }}$ carbon.

## Examples

1Ethyne reacts with brown bromine vapour to form 1,1,2,2tetrabromoethane. Chemical equation

2.Propyne reacts with chlorine to form 1,1,2,2-tetrachloropropane.

Chemical equation

3(a)But-1-yne undergo halogenation to form 1,1,2,2-tetraiodobutane with iodine Chemical equation

(b) But-2-yne undergo halogenation to form 2,2,3,3-tetrafluorobutane with fluorine

4. But-1,3-diyne should undergo halogenation to form $1,1,2,3,3,4,4$ octaiodobutane. The reaction uses four moles of iodine molecules/eight iodine atoms to break the two(2) triple double bonds at carbon " 1 " and " 2 ".

$$
\text { But-1,3-diene } \quad+\text { iodine } \longrightarrow \text { 1,2,3,4-tetraiodobutane }
$$

$$
\mathrm{HC} \square \mathrm{C} \mathrm{C} \equiv \mathrm{CH}+4 \mathrm{I}_{2} \quad \longrightarrow \mathrm{HC} \mathrm{I}_{2} \mathrm{C} \mathrm{I}_{2} \mathrm{C} \mathrm{I}_{2} \mathrm{C} \mathrm{H} \mathrm{I}_{2}
$$

(iii) Reaction with hydrogen halides.

Hydrogen halides reacts with alkyne to form a halogenoalkene then
halogenoalkane. The triple bond in the alkyne break and form a double then single bond.

The main compound is one which the hydrogen atom bond at the carbon with more hydrogen .
Examples

1. Ethyne reacts with hydrogen bromide to form bromoethane.

Chemical equation

2. Propyne reacts with hydrogen iodide to form 2,2-diiodopropane (as the main product )
Chemical equation

3. Both But-1-yne and But-2-yne reacts with hydrogen bromide to form 2,2dibromobutane

Chemical equation
But-1-ene + hydrogen bromide $\longrightarrow$ 2,2-dibromobutane

$$
\mathrm{H}_{3} \mathrm{CCH}_{2} \mathrm{C}=\mathrm{CH}+2 \mathrm{HBr} \longrightarrow \mathrm{H}_{3} \mathrm{CCH}_{2} \mathrm{CHBr}^{-\mathrm{CH}_{3}}
$$

But-2-yne + Hydrogen bromide $\longrightarrow$ 2,2-dibromobutane

$$
\mathrm{H}_{3} \mathrm{CC} \equiv \mathrm{C}-\mathrm{CH}_{3}+2 \mathrm{HBr} \longrightarrow \mathrm{H}_{3} \mathrm{C} \mathrm{CBr}_{2} \mathrm{CH}_{2}-\mathrm{CH}_{3}
$$

4. But-1,3-diene react with hydrogen iodide to form 2,3- diiodobutane. The reaction uses four moles of hydrogen iodide molecules/four iodine atoms and two hydrogen atoms to break the two double bonds.

> But-1,3-diyne + iodine $\longrightarrow$ 2,2,3,3-tetraiodobutane
> $\mathrm{HC}_{=} \mathrm{CCC}^{=}=\mathrm{CH}+\mathbf{4 H I} \longrightarrow \mathrm{H}_{3} \mathrm{CC} \mathrm{I}_{2} \mathrm{CI}_{2} \mathrm{CH}_{3}$

## B.ALKANOLS(Alcohols)

## (A) INTRODUCTION.

Alkanols belong to a homologous series of organic compounds with a general formula $\mathbf{C}_{\mathbf{n}} \mathbf{H}_{\mathbf{2}} \mathbf{+ 1} \mathbf{O H}$ and thus - $\mathbf{O H}$ as the functional group. The $1^{\text {st }}$ ten alkanols include

| n | General / <br> molecular <br> formular | Structural formula | IUPAC |
| :--- | :--- | :--- | :--- | :--- |
| name |  |  |  |$|$| Methanol |
| :--- |
| 1 |
| $\mathrm{CH}_{3} \mathrm{OH}$ |

|  |  | H HHHHH |  |
| :---: | :---: | :---: | :---: |
| 7 | $\begin{aligned} & \mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{6} \mathrm{OH} \\ & \mathrm{C}_{7} \mathrm{H}_{15} \mathrm{OH} \end{aligned}$ |  | Heptanol |
| 8 | $\begin{aligned} & \mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{7} \mathrm{OH} \\ & \mathrm{C}_{8} \mathrm{H}_{17} \mathrm{OH} \end{aligned}$ |  | Octanol |
| 9 | $\begin{aligned} & \mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{8} \mathrm{OH} \\ & \mathrm{C}_{9} \mathrm{H}_{19} \mathrm{OH} \end{aligned}$ |  | Nonanol |
| 10 |  |  | Decanol |

Alkanols like Hydrocarbons( alkanes/alkenes/alkynes) form a homologous series where:
(i)general name is derived from the alkane name then ending with "-
ol" (ii)the members have -OH as the fuctional group
(iii)they have the same general formula represented by R-OH where R is an alkyl group.
(iv) each member differ by $-\mathrm{CH}_{2}$ group from the next/previous.
(v)they show a similar and gradual change in their physical properties e.g. boiling and melting points.
(vi)they show similar and gradual change in their chemical properties.

## B. ISOMERS OF ALKANOLS.

Alkanols exhibit both structural and position isomerism. The isomers are named by using the following basic guidelines:
(i)Like alkanes, identify the longest carbon chain to be the parent name.
(ii)Identify the position of the - $\mathbf{O H}$ functional group to give it the smallest /lowest position.
(iii) Identify the type and position of the side branches.

## Practice examples of isomers of alkanols

## (i)Isomers of propanol $\mathrm{C}_{3} \mathrm{H}_{7} \mathrm{OH}$

$\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}$ - Propan-1-ol

Propan-2-ol and Propan-1-ol are position isomers because only the position of the OH functional group changes.

## (ii)Isomers of Butanol $\mathbf{C 4 H 9 O H}$

## $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}$ Butan-1-ol

Butan-2-ol and Butan-1-ol are position isomers because only the position of the -OH functional group changes.
2-methylpropan-2-ol is both a structural and position isomers because both the position of the functional group and the arrangement of the atoms in the molecule changes.
(iii)Isomers of Pentanol $\mathrm{C}_{5} \mathrm{H}_{11} \mathrm{OH}$
$\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ OH Pentan-1-ol (Position isomer)

## $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CHCH}_{3}$ OH

Pentan-2-ol (Position isomer)

2-methylbutan-2-ol (Position/structural isomer)

$\mathrm{CH}_{3}$
2,2-dimethylbutan-1-ol (Position /structural isomer)

2,3-dimethylbutan-1-ol (Position /structural isomer)
(iv)1,2-dichloropropan-2-ol

(v)1,2-dichloropropan-1-ol

## (vi) Ethan1,2-diol

$\mathrm{HOCH}_{2} \mathrm{CH}_{2} \mathrm{OH}$

## (vii) Propan1,2,3-triol

$\mathrm{HOCH}_{2} \mathrm{CHOHCH}_{2} \mathrm{OH}$

## C. LABORATORY PREPARATION OF ALKANOLS.

For decades the world over, people have been fermenting grapes juice, sugar, carbohydrates and starch to produce ethanol as a social drug for relaxation.
In large amount, drinking of ethanol by mammals /human beings causes mental and physical lack of coordination.
Prolonged intake of ethanol causes permanent mental and physical lack of coordination because it damages vital organs like the liver.
Fermentation is the reaction where sugar is converted to alcohol/alkanol using biological catalyst/enzymes in yeast.
It involves three processes:
(i)Conversion of starch to maltose using the enzyme diastase.
$\left(\mathrm{C}_{6} \mathrm{H}_{10} \mathrm{O}_{5}\right) \mathrm{n}(\mathrm{s})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \quad$--diastase enzyme --> $\mathrm{C}_{12} \mathrm{H}_{22} \mathrm{O}_{11}(\mathrm{aq})$
(Starch) (Maltose)
(ii)Hydrolysis of Maltose to glucose using the enzyme maltase.
$\mathrm{C}_{12} \mathrm{H}_{22} \mathrm{O}_{11}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \quad-$ maltase enzyme $-->2 \mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}(\mathrm{aq})$
(Maltose) (glucose)
(iii)Conversion of glucose to ethanol and carbon(IV)oxide gas using the enzyme zymase.

$$
\begin{array}{ll}
\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}(\mathrm{aq}) \\
\text { (glucose) }
\end{array} \quad-\text { zymase enzyme -->> } \underset{\text { (Ethanol) }}{2 \mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(\mathrm{aq})+2 \mathrm{CO}_{2}(\mathrm{~g})}
$$

At concentration greater than $15 \%$ by volume, the ethanol produced kills the yeast enzyme stopping the reaction.

To increases the concentration, fractional distillation is done to produce spirits (e.g. Brandy $=40 \%$ ethanol).
Methanol is much more poisonous /toxic than ethanol.
Taken large quantity in small quantity it causes instant blindness and liver, killing the consumer victim within hours.

School laboratory preparation of ethanol from fermentation of glucose
Measure 100 cm 3 of pure water into a conical flask.
Add about five spatula end full of glucose.
Stir the mixture to dissolve.
Add about one spatula end full of yeast.
Set up the apparatus as below.

Preserve the mixture for about three days.

## D.PHYSICAL AND CHEMICAL PROPERTIES OF ALKANOLS

Use the prepared sample above for the following experiments that shows the characteristic properties of alkanols
(a) Role of yeast

Yeast is a single cell fungus which contains the enzyme maltase and zymase that catalyse the fermentation process.
(b) Observations in lime water.

A white precipitate is formed that dissolve to a colourless solution later. Lime water/Calcium hydroxide reacts with carbon(IV)0xide produced during the fermentation to form insoluble calcium carbonate and water.
More carbon (IV)0xide produced during fermentation react with the insoluble calcium carbonate and water to form soluble calcium hydrogen carbonate.

$$
\begin{aligned}
& \mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{aq})_{2} \\
& \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g})
\end{aligned}+\begin{aligned}
& \mathrm{CO}_{2}(\mathrm{~g}) \\
& \mathrm{CaCO}_{3}(\mathrm{~s})->
\end{aligned} \quad \begin{aligned}
& \mathrm{CaCO}_{3}(\mathrm{~s}) \\
& \mathrm{Ca}\left(\mathrm{HCO}_{3}\right)_{2}(\mathrm{aq})
\end{aligned}
$$

## (c)Effects on litmus paper

## Experiment

Take the prepared sample and test with both blue and red litmus papers.
Repeat the same with pure ethanol and methylated spirit.
Sample Observation table

| Substance/alkanol | Effect on litmus paper |
| :--- | :--- |
| Prepared sample | Blue litmus paper remain blue <br> Red litmus paper remain red |
| Absolute ethanol | Blue litmus paper remain blue <br> Red litmus paper remain red |
| Methylated spirit | Blue litmus paper remain blue <br> Red litmus paper remain red |

## Explanation

Alkanols are neutral compounds/solution that have characteristic sweet smell and taste.
They have no effect on both blue and red litmus papers.

## (d)Solubility in water.

## Experiment

Place about 5 cm 3 of prepared sample into a clean test tube Add equal amount of distilled water.
Repeat the same with pure ethanol and methylated spirit.
Observation
No layers formed between the two liquids.

## Explanation

Ethanol is miscible in water.Both ethanol and water are polar compounds .

The solubility of alkanols decrease with increase in the alkyl chain/molecular mass. The alkyl group is insoluble in water while - OH functional group is soluble in water.
As the molecular chain becomes longer ,the effect of the alkyl group increases as the effect of the functional group decreases.

## e)Melting/boiling point.

## Experiment

Place pure ethanol in a long boiling tube .Determine its boiling point.
Observation
Pure ethanol has a boiling point of $78^{\circ} \mathrm{C}$ at sea level/one atmosphere pressure. Explanation
The melting and boiling point of alkanols increase with increase in molecular chain/mass .
This is because the intermolecular/van-der-waals forces of attraction between the molecules increase.
More heat energy is thus required to weaken the longer chain during melting and break during boiling.

## f)Density

Density of alkanols increase with increase in the intermolecular/van-der-waals forces of attraction between the molecule, making it very close to each other.
This reduces the volume occupied by the molecule and thus increase the their mass per unit volume (density).

Summary table showing the trend in physical properties of alkanols

| Alkanol | Melting point <br> $\left({ }^{\circ} \mathrm{C}\right)$ | Boiling point <br> $\left({ }^{\circ} \mathrm{C}\right)$ | Density <br> $\mathrm{gcm}^{-3}$ | Solubility in water |
| :--- | :--- | :--- | :--- | :--- |
| Methanol | -98 | 65 | 0.791 | soluble |
| Ethanol | -117 | 78 | 0.789 | soluble |
| Propanol | -103 | 97 | 0.803 | soluble |
| Butanol | -89 | 117 | 0.810 | Slightly soluble |
| Pentanol | -78 | 138 | 0.814 | Slightly soluble |
| Hexanol | -52 | 157 | 0.815 | Slightly soluble |
| Heptanol | -34 | 176 | 0.822 | Slightly soluble |
| Octanol | -15 | 195 | 0.824 | Slightly soluble |
| Nonanol | -7 | 212 | 0.827 | Slightly soluble |
| Decanol | 6 | 228 | 0.827 | Slightly soluble |

## g)Burning

## Experiment

Place the prepared sample in a watch glass. Ignite. Repeat with pure ethanol and methylated spirit.
Observation/Explanation
Fermentation produce ethanol with a lot of water(about a ratio of 1:3)which prevent the alcohol from igniting.
Pure ethanol and methylated spirit easily catch fire / highly flammable.
They burn with an almost colourless non-sooty/non-smoky blue flame to form carbon(IV) oxide (in excess air/oxygen)or carbon(II) oxide (limited air) and water.
Ethanol is thus a saturated compound like alkanes.
Chemica equation

| $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(\mathrm{l})$ | $+3 \mathrm{O}_{2}(\mathrm{~g})$ | $->3 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ | + | $2 \mathrm{CO}_{2}(\mathrm{~g})$ ( excess air) |
| :---: | :---: | :--- | :--- | :--- |
| $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(\mathrm{l})$ | $+2 \mathrm{O}_{2}(\mathrm{~g})$ | $->3 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ | + | $2 \mathrm{CO}(\mathrm{g})$ ( limited air) |
|  |  |  |  |  |
| $2 \mathrm{CH}_{3} \mathrm{OH}(\mathrm{l})$ | $+3 \mathrm{O}_{2}(\mathrm{~g})$ | $->4 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ | + | $2 \mathrm{CO}_{2}(\mathrm{~g})$ ( excess air) |
| $2 \mathrm{CH}_{3} \mathrm{OH}(\mathrm{l})$ | $+2 \mathrm{O}_{2}(\mathrm{~g})$ | $->4 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ | + | $2 \mathrm{CO}(\mathrm{g})$ (limited air) |
| $2 \mathrm{C}_{3} \mathrm{H}_{7} \mathrm{OH}(\mathrm{l})$ | $+9 \mathrm{O}_{2}(\mathrm{~g})$ | $->8 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ | + | $6 \mathrm{CO}_{2}(\mathrm{~g})$ ( excess air) |
| $\mathrm{C}_{3} \mathrm{H}_{7} \mathrm{OH}(\mathrm{l})$ | $+3 \mathrm{O}_{2}(\mathrm{~g})$ | $->4 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ | + | $3 \mathrm{CO}(\mathrm{g})$ (limited air) |
| $2 \mathrm{C}_{4} \mathrm{H}_{9} \mathrm{OH}(\mathrm{l})$ | $+13 \mathrm{O}_{2}(\mathrm{~g})$ | $->20 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ | $+3 \mathrm{CO}_{2}(\mathrm{~g})$ (excess air) |  |
| $\mathrm{C}_{4} \mathrm{H}_{9} \mathrm{OH}(\mathrm{l})$ | $+3 \mathrm{O}_{2}(\mathrm{~g})$ | $->4 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ | $+3 \mathrm{CO}(\mathrm{g})$ (limited air) |  |

Due to its flammability, ethanol is used;
(i) as a fuel in spirit lamps
(ii) as gasohol when blended with gasoline

## (h)Formation of alkoxides

## Experiment

Cut a very small piece of sodium. Put it in a beaker containing about 20 cm 3 of the prepared sample in a beaker.
Test the products with litmus papers. Repeat with absolute ethanol and methylated spirit.
Sample observations

| Substance/alkanol | Effect of adding sodium |
| :--- | :--- |
| Fermentation prepared sample | (i)effervescence/fizzing/bubbles |

|  | (ii)colourless gas produced that <br> extinguish burning splint with explosion/ <br> "Pop" sound <br> (iii)colourless solution formed <br>  <br> (iv)blue litmus papers remain blue <br> (v)red litmus papers turn blue |
| :--- | :--- |
| Pure/absolute ethanol/methylated spirit | (i)slow effervescence/fizzing/bubbles <br> (ii)colourless gas slowly produced that |
|  | extinguish burning splint with explosion/ <br> "Pop" sound |
|  | (iii)colourless solution formed <br> (iv)blue litmus papers remain blue |
|  | (v)red litmus papers turn blue |

## Explanations

Sodium/potassium reacts slowly with alkanols to form basic solution called alkoxides and producing hydrogen gas.
If the alkanol has some water the metals react faster with the water to form soluble hydroxides/alkalis i.e.

| Sodium | + | Alkanol | $->$ | Sodium alkoxides | + Hydrogen gas |
| :--- | :--- | :--- | :--- | :---: | :--- |
| Potassium | + | Alkanol | $->$ | Potassium alkoxides | +Hydrogen gas |

## Examples

1.Sodium metal reacts with ethanol to form sodium ethoxide

Sodium metal reacts with water to form sodium Hydroxide

| $2 \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{l})$ | + | $2 \mathrm{Na}(\mathrm{s})$ | $\rightarrow$ | $2 \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{ONa}(\mathrm{aq})$ |
| :--- | :--- | :--- | :--- | :--- |
| $2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ | + | $2 \mathrm{Na}(\mathrm{s})$ | $->$ | $2 \mathrm{NaOH}(\mathrm{Hq}) \quad+\mathrm{H}_{2}(\mathrm{~s})$ |

2.Potassium metal reacts with ethanol to form Potassium ethoxide

Potassium metal reacts with water to form Potassium Hydroxide
$2 \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{l})+2 \mathrm{~K}(\mathrm{~s}) \quad->2 \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OK}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~s})$
$2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \quad+2 \mathrm{~K}(\mathrm{~s}) \quad->\quad 2 \mathrm{KOH}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~s})$
3.Sodium metal reacts with propanol to form sodium propoxide

Sodium metal reacts with water to form sodium Hydroxide
$2 \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{l})+2 \mathrm{Na}(\mathrm{s})->2 \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{ONa}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~s})$
$2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \quad+2 \mathrm{Na}(\mathrm{s}) \quad->\quad 2 \mathrm{NaOH}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~s})$
4.Potassium metal reacts with propanol to form Potassium propoxide
Potassium metal reacts with water to form Potassium Hydroxide
$2 \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{l}) \quad+\quad 2 \mathrm{~K}(\mathrm{~s}) \quad->2 \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OK}(\mathrm{aq}) \quad+\mathrm{H}_{2}(\mathrm{~s})$
$2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+2 \mathrm{~K}(\mathrm{~s}) \quad->2 \mathrm{KOH}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~s})$
5.Sodium metal reacts with butanol to form sodium butoxide

Sodium metal reacts with water to form sodium Hydroxide

$$
\begin{aligned}
& 2 \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{l})+2 \mathrm{Na}(\mathrm{~s})->{ }_{2}^{2 \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{ONa}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~s})} \\
& 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+2 \mathrm{Na}(\mathrm{~s}) \quad->\quad 2 \mathrm{NaOH}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~s})
\end{aligned}
$$

6.Sodium metal reacts with pentanol to form sodium pentoxide

Sodium metal reacts with water to form sodium Hydroxide
$2 \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{l})+2 \mathrm{Na}(\mathrm{s})->2 \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{ONa}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~s})$
$2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \quad+\quad 2 \mathrm{Na}(\mathrm{s}) \quad->\quad 2 \mathrm{NaOH}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~s})$

## (i)Formation of Esters/Esterification

## Experiment

Place 2 cm 3 of ethanol in a boiling tube.
Add equal amount of ethanoic acid.To the mixture add carefully 2drops of concentrated sulphuric(VI)acid.
Warm/Heat gently.
Pour the mixture into a beaker containing about 50 cm 3 of cold water.
Smell the products.
Repeat with methanol
Sample observations

| Substance/alkanol | Effect on adding equal amount of <br> ethanol/concentrated sulphuric(VI)acid |
| :--- | :--- |
| Absolute ethanol | Sweet fruity smell |
| Methanol | Sweet fruity smell |

## Explanation

Alkanols react with alkanoic acids to form a group of homologous series of sweet smelling compounds called esters and water. This reaction is catalyzed by concentrated sulphuric(VI) acid in the laboratory.

## Alkanol + Alkanoic acid -Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}->$ Ester + water

Naturally esterification is catalyzed by sunlight. Each ester has a characteristic smell derived from the many possible combinations of alkanols and alkanoic acids that
create a variety of known natural(mostly in fruits) and synthetic(mostly in juices) esters .
Esters derive their names from the alkanol first then alkanoic acids. The alkanol "becomes" an alkyl group and the alkanoic acid "becomes" alkanoate hence alkylalkanoate. e.g.

| Ethanol | + | Ethanoic acid | $->$ | Ethylethanoate | + Water |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Ethanol | + | Propanoic acid | $->$ | Ethylpropanoate | + Water |
| Ethanol | + | Methanoic acid | $->$ | Ethylmethanoate | + Water |
| Ethanol | + | butanoic acid | $->$ | Ethylbutanoate | + Water |
| Propanol | + | Ethanoic acid | $->$ | Propylethanoate | + Water |
| Methanol | + | Ethanoic acid | $->$ | Methyethanoate | + Water |
| Methanol | + | Decanoic acid | $->$ | Methyldecanoate | + Water |
| Decanol | + | Methanoic acid | $->$ | Decylmethanoate | + Water |

During the formation of the ester, the " O " joining the alkanol and alkanoic acid comes from the alkanol.
$\mathrm{R}_{1}-\mathrm{COOH}+\mathrm{R}_{2}-\mathrm{OH} \quad->\quad \mathrm{R}_{1}-\mathrm{COO}-\mathrm{R}_{2}+\mathrm{H}_{2} \mathbf{O}$ e.g.

1. Ethanol reacts with ethanoic acid to form the ester ethyl ethanoate and water.

Ethanol + Ethanoic acid --Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$-->Ethylethanoate + Water
$\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(\mathrm{l})+\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{l})$--Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$--> $\mathrm{CH}_{3} \mathrm{COO} \mathrm{C}_{2} \mathrm{H}_{5}(\mathbf{a q})+\mathrm{H}_{2} \mathrm{O}(1)$ $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{l})+\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{l})-$--Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}-->\mathrm{CH}_{3} \mathrm{COOCH}_{2} \mathrm{CH}_{3}(\mathbf{a q})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
2. Ethanol reacts with propanoic acid to form the ester ethylpropanoate and water.

Ethanol + Propanoic acid --Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$-->Ethylethanoate + Water $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(\mathrm{l})+\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COOH}(\mathrm{l})-$-Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}-->\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COO} \mathrm{C}_{2} \mathrm{H}_{5}(\mathbf{a q})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{l})+\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COOH}(\mathrm{l})$--Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$-->
$\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COOCH}_{2} \mathrm{CH}_{3}(\mathbf{a q})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
3. Methanol reacts with ethanoic acid to form the ester methyl ethanoate and water.

Methanol + Ethanoic acid --Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}-->$ Methylethanoate + Water
$\mathrm{CH}_{3} \mathrm{OH}(\mathrm{l})+\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{l})$--Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}-->\mathrm{CH}_{3} \mathrm{COO} \mathrm{CH}_{3}(\mathbf{a q})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
4. Methanol reacts with propanoic acid to form the ester methyl propanoate and water.

Methanol + propanoic acid --Conc. $\mathrm{H}_{2} \mathrm{SO} 4$-->Methylpropanoate + Water $\mathrm{CH}_{3} \mathrm{OH}(\mathrm{l})+\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COOH}(\mathrm{l})$--Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$--> $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COO} \mathrm{CH}_{3}(\mathbf{a q})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
5. Propanol reacts with propanoic acid to form the ester propylpropanoate and water.

Propanol + Propanoic acid --Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$-->Ethylethanoate + Water $\mathrm{C}_{3} \mathrm{H}_{7} \mathrm{OH}(\mathrm{l})+\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COOH}_{(1)}$--Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}-->\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COO} \mathrm{C}_{3} \mathrm{H}_{7}(\mathbf{a q})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{l})+\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COOH}(\mathrm{l})$--Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$-->
$\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COOCH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}(\mathbf{a q})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$

## (j) Oxidation

## Experiment

Place 5 cm 3 of absolute ethanol in a test tube.Add three drops of acidified potassium manganate(VII).Shake thoroughly for one minute/warm.Test the solution mixture using pH paper. Repeat by adding acidified potassium dichromate(VII).
Sample observation table

| Substance/alkanol | Adding acidified $\mathrm{KMnO}_{4} / \mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ | pH of resulting solution/mixture | Nature of resulting solution/mixture |
| :---: | :---: | :---: | :---: |
| Pure ethanol | (i)Purple colour of $\mathrm{KMnO}_{4}$ decolorized | $\mathrm{pH}=4 / 5 / 6$ | Weakly acidic |
|  | (ii) Orange colour of $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ turns green. | $\mathrm{pH}=4 / 5 / 6$ | Weakly acidic |

## Explanation

Both acidified $\mathrm{KMnO}_{4}$ and $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ are oxidizing agents(add oxygen to other compounds. They oxidize alkanols to a group of homologous series called alkanals then further oxidize them to alkanoic acids.The oxidizing agents are themselves reduced hence changing their colour:
(i) Purple $\mathrm{KMnO}_{4}$ is reduced to colourless $\mathrm{Mn}^{2+}$
(ii) Orange $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}$ 7is reduced to green $\mathrm{Cr}^{3+}$

The pH of alkanoic acids show they have few $\mathrm{H}^{+}$because they are weak acids i.e

$$
\text { Alkanol }+[\mathrm{O}] \text {-> Alkanal }+[\mathrm{O}] \text {-> alkanoic acid }
$$

NB The [O] comes from the oxidizing agents acidified $\mathrm{KMnO}_{4}$ or $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ Examples

1. When ethanol is warmed with three drops of acidified $\mathrm{KMnO}_{4}$ there is decolorization of $\mathrm{KMnO}_{4}$

| Ethanol | $+[\mathrm{O}]->$ | Ethanal | + | $[\mathrm{O}]$ | $->$ |
| :---: | :---: | :---: | :---: | :---: | :---: | Ethanoic acid

2. When methanol is warmed with three drops of acidified $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$,the orange colour of acidified $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ changes to green.

$$
\begin{array}{rlrlll}
\text { methanol } & +[\mathrm{O}]-> & \text { methanal } & +[\mathrm{O}] & -> & \text { methanoic acid } \\
\mathrm{CH}_{3} \mathrm{OH} & +[\mathrm{O}]-> & \mathrm{CH}_{3} \mathrm{O} & +[\mathrm{O}] & -> & \mathrm{HCOOH}
\end{array}
$$

3. When propanol is warmed with three drops of acidified $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$, the orange colour of acidified $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ changes to green.

$$
\overline{\text { Propanol }}+[\mathrm{O}] \text {-> } \quad \text { Propanal+ }[\mathrm{O}] \quad \text {-> } \quad \text { Propanoic acid }
$$

$\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}+[\mathrm{O}] \quad$-> $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{O}+[\mathrm{O}]$-> $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COOH}$ 4. When butanol is warmed with three drops of acidified $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$, the orange colour of acidified $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ changes to green.

Butanol + [O] -> Butanal + [O] -> Butanoic acid $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}+[\mathrm{O}]->\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{O}+[\mathrm{O}]->\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COOH}$

Air slowly oxidizes ethanol to dilute ethanoic acid commonly called vinegar. If beer is not tightly corked, a lot of carbon(IV)oxide escapes and there is slow oxidation of the beer making it "flat".

## (k)Hydrolysis /Hydration and Dehydration

I. Hydrolysis/Hydration is the reaction of a compound/substance with water. Alkenes react with water vapour/steam at high temperatures and high pressures in presence of phosphoric acid catalyst to form alkanols.i.e.
Alkenes + Water $-\mathrm{H}_{3} \mathrm{PO}_{4}$ catalyst-> Alkanol
Examples
(i)Ethene is mixed with steam over a phosphoric acid catalyst at $300^{\circ} \mathrm{C}$
temperature and 60 atmosphere pressure to form ethanol
Ethene + water --- $60 \mathrm{~atm} / 300^{\circ} \mathrm{C} / \mathrm{H}_{3} \mathrm{PO}_{4} \quad$--> Ethanol
$\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})--60 \mathrm{~atm} / 300^{\circ} \mathrm{C} / \mathrm{H}_{3} \mathrm{PO}_{4}-->\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{l})$
This is the main method of producing large quantities of ethanol instead of fermentation
(ii) Propene + water ---60 atm $/ 300^{\circ} \mathrm{C} / \mathrm{H}_{3} \mathrm{PO}_{4}$--> Propanol
$\mathrm{CH}_{3} \mathrm{C}=\mathrm{CH}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})--60 \mathrm{~atm} / 300^{\circ} \mathrm{C} / \mathrm{H}_{3} \mathrm{PO}_{4} \quad-->\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{l})$
(iii) Butene + water ---60 atm $/ 300^{\circ} \mathrm{C} / \mathrm{H}_{3} \mathrm{PO}_{4}$--> Butanol
$\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{C}=\mathrm{CH}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})--60 \mathrm{~atm} / 300^{\circ} \mathrm{C} / \mathrm{H}_{3} \mathrm{POO}_{4}-->\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{l})$
II. Dehydration is the process which concentrated sulphuric(VI)acid (dehydrating agent) removes water from a compound/substances.
Concentrated sulphuric(VI)acid dehydrates alkanols to the corresponding alkenes at about $180^{\circ} \mathrm{C}$. i.e
Alkanol --Conc. $\mathrm{H}_{2} \mathrm{SO}_{4} / 180^{\circ} \mathrm{C}$--> Alkene + Water
Examples

1. At $180^{\circ} \mathrm{C}$ and in presence of Concentrated sulphuric(VI)acid, ethanol undergoes dehydration to form ethene.

| Ethanol | $---180 \circ \mathrm{O}_{2} \mathrm{H}_{2} \mathrm{SO}_{4}$ | $-->$ | Ethene | + Water |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{l})$ | $--180_{\circ} \mathrm{C} / \mathrm{H}_{2} \mathrm{SO}_{4}$ | $-->$ | $\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ |  |

2. Propanol undergoes dehydration to form propene.

$$
\text { Propanol } \quad---180_{0} \mathrm{C} / \mathrm{H}_{2} \mathrm{SO}_{4} \quad-->\text { Propene }+ \text { Water }
$$

$\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{l})--180_{\circ} \mathrm{C} / \mathrm{H}_{2} \mathrm{SO}_{4} \quad-->\quad \mathrm{CH}_{3} \mathrm{CH}=\mathrm{CH}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
3. Butanol undergoes dehydration to form Butene.

Butanol ---1800C/ H2SO4 --> Butene + Water
$\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{l}) \quad--1800_{0} \mathrm{C} / \mathrm{H}_{2} \mathrm{SO}_{4} \quad$--> $\quad \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{C}=\mathrm{CH}_{2}(\mathrm{~g})$

## $+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$

3. Pentanol undergoes dehydration to form Pentene.

Pentanol --- $1800_{0} \mathrm{C} / \mathrm{H}_{2} \mathrm{SO}_{4}-->$ Pentene + Water
$\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{l})--180^{\circ} \mathrm{C} / \mathrm{H}_{2} \mathrm{SO}_{4}-->\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{C}=\mathrm{CH}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$

## (l)Similarities of alkanols with

## Hydrocarbons I. Similarity with alkanes

Both alkanols and alkanes burn with a blue non-sooty flame to form carbon(IV)oxide(in excess air/oxygen)/carbon(II)oxide(in limited air) and water.
This shows they are saturated with high C:H ratio. e.g.
Both ethanol and ethane ignite and burns in air with a blue non-sooty flame to form carbon(IV)oxide(in excess air/oxygen)/carbon(II)oxide(in limited air) and water.

$$
\begin{array}{ll}
\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{l})+3 \mathrm{O}_{2}(\mathrm{~g}) \text {-Excess air-> } & 2 \mathrm{CO}_{2}(\mathrm{~g})+3 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{l})+2 \mathrm{O}_{2}(\mathrm{~g}) \text {-Limited air-> } & 2 \mathrm{CO}(\mathrm{~g})+3 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
\end{array}
$$

$\mathrm{CH}_{3} \mathrm{CH}_{3}(\mathrm{~g})+3 \mathrm{O}_{2}(\mathrm{~g})$-Excess air-> $2 \mathrm{CO}_{2}(\mathrm{~g})+3 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
$2 \mathrm{CH}_{3} \mathrm{CH}_{3}(\mathrm{~g})+5 \mathrm{O}_{2}(\mathrm{~g})$-Limited air-> $4 \mathrm{CO}(\mathrm{g})+6 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$

## II. Similarity with alkenes/alkynes

Both alkanols(R-OH) and alkenes/alkynes(with $=\mathrm{C}=\mathrm{C}=$ double and $-\mathrm{C}=\mathrm{C}$ triple ) bond:
(i)decolorize acidified $\mathrm{KMnO}_{4}$
(ii)turns Orange acidified $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ to green.

Alkanols $(\mathrm{R}-\mathrm{OH})$ are oxidized to alkanals(R-O) ant then alkanoic acids( $\mathrm{R}-\mathrm{OOH}$ ). Alkenes are oxidized to alkanols with duo/double functional groups.
Examples

1. When ethanol is warmed with three drops of acidified $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ the orange of acidified $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ turns to green. Ethanol is oxidized to ethanol and then to ethanoic acid.

$$
\begin{aligned}
& \text { Ethanol }+[\mathrm{O}]-> \\
& \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}+[\mathrm{E}]-> \\
& \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{O} \\
& +[\mathrm{O}]
\end{aligned}
$$

2. When ethene is bubbled in a test tube containing acidified $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$, the orange of acidified $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ turns to green. Ethene is oxidized to ethan-1,2-diol.
Ethene $+[\mathrm{O}] \quad->$ Ethan-1,2-diol.
$\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}_{2}+[\mathrm{O}] \quad->\quad \mathrm{HOCH}_{2}-\mathrm{CH}_{2} \mathrm{OH}$
III. Differences with alkenes/alkynes

Alkanols do not decolorize bromine and chlorine water.
Alkenes decolorizes bromine and chlorine water to form halogenoalkanols Example
When ethene is bubbled in a test tube containing bromine water,the bromine water is decolorized. Ethene is oxidized to bromoethanol.

$$
\begin{array}{ll}
\text { Ethene + Bromine water -> } \mathrm{H}_{2} \mathrm{C}=\mathrm{CH}_{2} & \text { Bromoethanol. } \\
+\mathrm{HOBr}-> & \mathrm{BrCH}_{2}-\mathrm{CH}_{2} \mathrm{OH}
\end{array}
$$

IV. Differences in melting and boiling point with Hydrocarbons

Alkanos have higher melting point than the corresponding hydrocarbon (alkane/alkene/alkyne)
This is because most alkanols exist as dimer.A dimer is a molecule made up of two other molecules joined usually by van-der-waals forces/hydrogen bond or dative bonding.
Two alkanol molecules form a dimer joined by hydrogen bonding.
Example
In Ethanol the oxygen atom attracts/pulls the shared electrons in the covalent bond more to itself than Hydrogen.
This creates a partial negative charge $\left({ }^{\boldsymbol{\delta}-}\right)$ on oxygen and partial positive charge $\left({ }^{\boldsymbol{\delta +}}\right)$ on hydrogen.
Two ethanol molecules attract each other at the partial charges through Hydrogen bonding forming a dimmer.

Dimerization of alkanols means more energy is needed to break/weaken the Hydrogen bonds before breaking/weakening the intermolecular forces joining the molecules of all organic compounds during boiling/melting.

## E.USES OF SOME ALKANOLS

(a)Methanol is used as industrial alcohol and making methylated spirit
(b)Ethanol is used:

1. as alcohol in alcoholic drinks e.g Beer, wines and spirits.
2.as antiseptic to wash woulds
3.in manufacture of vanishes, ink, glue and paint because it is volatile and thus easily evaporate
4.as a fuel when blended with petrol to make gasohol.

## B.ALKANOIC ACIDS (Carboxylic acids)

## (A) INTRODUCTION.

Alkanoic acids belong to a homologous series of organic compounds with a general formula $\mathbf{C}_{\mathbf{n}} \mathbf{H}_{\mathbf{2 n}} \mathbf{+ 1} \mathbf{C O O H}$ and thus $\mathbf{-} \mathbf{C O O H}$ as the functional group .The $1^{\text {st }}$ ten alkanoic acids include:

Alkanoic acids like alkanols /alkanes/alkenes/alkynes form a homologous series where:
(i)the general name of an alkanoic acids is derived from the alkane name then ending with "-oic" acid as the table above shows.
(ii) the members have $\mathrm{R}-\mathrm{COOH} / \mathrm{R}-\mathrm{C}-\mathrm{O}-\mathrm{H}$ as the functional group.

| n | General/molecular formular | Structural formula | IUPAC name |
| :---: | :---: | :---: | :---: |
| 0 | HCOOH |  | Methanoic acid |
| 1 | $\mathrm{CH}_{3} \mathrm{COOH}$ |  | Ethanoic acid |
| 2 | $\begin{aligned} & \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COOH} \\ & \mathrm{C}_{2} \mathrm{H}_{5} \mathrm{COOH} \end{aligned}$ |  | Propanoic acid |
| 3 | $\begin{aligned} & \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{COOH} \\ & \mathrm{C}_{3} \mathrm{H}_{7} \mathrm{COOH} \end{aligned}$ |  | Butanoic acid |
| 4 | $\begin{aligned} & \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \\ & \mathrm{COOH} \\ & \mathrm{C}_{4} \mathrm{H} 9 \mathrm{COOH} \end{aligned}$ |  | Pentanoic acid |
| 5 | $\begin{aligned} & \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \\ & \mathrm{COOH} \\ & \mathrm{C}_{5} \mathrm{H}_{11} \mathrm{COOH} \end{aligned}$ |  | Hexanoic acid |
| 6 | $\begin{aligned} & \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \\ & \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{COOH} \end{aligned}$ |  | Pentanoic acid |

(iii)they have the same general formula represented by $\mathrm{R}-\mathrm{COOH}$ where R is an alkyl group.
(iv)each member differ by $-\mathrm{CH}_{2}$ - group from the next/previous.
(v)they show a similar and gradual change in their physical properties e.g. boiling and melting point.
(vi)they show similar and gradual change in their chemical properties.
(vii) since they are acids they show similar properties with mineral acids.

## (B) ISOMERS OF ALKANOIC ACIDS.

Alkanoic acids exhibit both structural and position isomerism. The isomers are named by using the following basic guidelines
(i)Like alkanes. identify the longest carbon chain to be the parent name.
(ii)Identify the position of the - $\mathrm{C}-\mathrm{O}-\mathrm{H}$ functional group to give it the smallest
/lowest position.
(iii)Identify the type and position of the side group branches.

Practice examples on isomers of alkanoic
acids 1.Isomers of butanoic acid $\mathrm{C}_{3} \underline{H}_{7} \underline{\mathrm{COOH}}$
$\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{COOH}$
Butan-1-oic acid

2-methylpropan-1-oic acid and Butan-1-oic acid are structural isomers because the position of the functional group does not change but the arrangement of the atoms in the molecule does.

## 2.Isomers of pentanoic acid $\mathrm{C}_{4} \underline{\mathrm{H}_{2}} \underline{\mathrm{COOH}}$

$\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{COOH}$ pentan-1-oic acid

3.Ethan-1,2-dioic acid

HOOC- COOH//

4.Propan-1,3-dioic acid

HOOC- $\mathrm{CH}_{2} \mathrm{COOH} / /$

5.Butan-1,4-dioic acid
$\mathrm{HOOC} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{COOH}$

6.2,2-dichloroethan-1,2-dioic acid $\mathrm{HOOCCHCl}_{2}$

## (C) LABORATORY AND INDUSTRIAL PREPARATIONOF ALKANOIC ACIDS.

In a school laboratory, alkanoic acids can be prepared by adding an oxidizing agent $\left(\mathrm{H}^{+} / \mathrm{KMnO}_{4}\right.$ or $\left.\mathrm{H}^{+} / \mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}\right)$ to the corresponding alkanol then warming.

The oxidation converts the alkanol first to an alkanal the alkanoic acid.
NB Acidified $\mathrm{KMnO}_{4}$ is a stronger oxidizing agent than acidified $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ General equation:

Examples
1.Ethanol on warming in acidified KMnO 4 is oxidized to ethanal then ethanoic acid .
$\mathrm{CH}_{3}-\mathrm{CH}_{2}-\mathrm{OH}+[\mathrm{O}] \quad--\mathrm{H}_{+} / \mathrm{KMnO}_{4}-->\quad \mathrm{CH}_{3}-\mathrm{CH}-\mathrm{O} \quad+\quad \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ (ethanol) (ethanal)
$\mathrm{CH}_{3}-\mathrm{CH}-\mathrm{O}+[\mathrm{O}] \quad--\mathrm{H}_{+} / \mathrm{KMnO}_{4}-->\quad \mathrm{CH}_{3}-\mathrm{C}-\mathrm{OOH}$ (ethanal) (ethanoic acid)

2Propanol on warming in acidified $\mathrm{KMnO}_{4}$ is oxidized to propanal then propanoic acid
$\mathrm{CH}_{3}-\mathrm{CH}_{2} \mathrm{CH}_{2}-\mathrm{OH}+[\mathrm{O}]--\mathrm{H}_{+} / \mathrm{KMnO}_{4}-->\quad \mathrm{CH}_{3}-\mathrm{CH}_{2} \mathrm{CH}-\mathrm{O}+\quad \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ (propanol)

$$
\begin{array}{rlll}
\mathrm{CH}_{3}-\mathrm{CH}-\mathbf{O} \\
\text { (propanal) }
\end{array} \quad+[\mathrm{O}] \quad--\mathrm{H}_{+} / \mathrm{KMnO}_{4}--\gg \begin{aligned}
& \mathrm{CH}_{3}-\mathrm{C}-\mathbf{O O H} \\
& \text { (propanoic acid) }
\end{aligned}
$$

(propanal)

Industrially,large scale manufacture of alkanoic acid like ethanoic acid is obtained from:
(a)Alkenes reacting with steam at high temperatures and pressure in presence of phosphoric(V)acid catalyst and undergo hydrolysis to form alkanols. i.e.

Alkenes + Steam/water -- H2PO4 Catalyst--> Alkanol
The alkanol is then oxidized by air at 5 atmosphere pressure with Manganese (II)sulphate(VI) catalyst to form the alkanoic acid.

Alkanol + Air -- MnSO4 Catalyst/5 atm pressure--> Alkanoic acid

## Example

Ethene is mixed with steam over a phosphoric(V)acid catalyst,300oC temperature and 60 atmosphere pressure to form ethanol.

$$
\underset{\text { (Ethene) }}{\mathrm{CH}_{2}=\mathrm{CH}_{2}}+\mathrm{H}_{2} \mathrm{O}->\underset{\text { (Ethanol) }}{\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}}
$$

This is the industrial large scale method of manufacturing ethanol Ethanol is then oxidized by air at 5 atmosphere pressure with Manganese (II)sulphate(VI) catalyst to form the ethanoic acid.

$$
\underset{\text { (Ethanol) }}{\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}}+\quad[\mathrm{O}]--\mathrm{MnSO}_{4} \text { Catalyst/5 atm pressure--> } \underset{\text { (Ethanoic acid) }}{\mathrm{CH}_{3} \mathrm{COOH}}
$$

(b)Alkynes react with liquid water at high temperatures and pressure in presence of Mercury(II)sulphate(VI)catalyst and 30\% concentrated sulphuric(VI)acid to form alkanals.
Alkyne $\quad+\quad$ Water -- Mercury(II)sulphate(VI)catalyst--> Alkanal

The alkanal is then oxidized by air at 5 atmosphere pressure with Manganese (II) sulphate(VI) catalyst to form the alkanoic acid.

Alkanal + air/oxygen -- Manganese(II)sulphate(VI)catalyst--> Alkanoic acid

## Example

Ethyne react with liquid water at high temperature and pressure with Mercury (II) sulphate (VI)catalyst and $30 \%$ concentrated sulphuric(VI)acid to form ethanal.

$$
\begin{aligned}
& \mathrm{CH} \equiv \mathrm{CH} \\
& \text { (Ethyne) }
\end{aligned} \quad+\mathrm{H}_{2} \mathrm{O}--\mathrm{HgSO}_{4}-->\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{O}
$$

This is another industrial large scale method of manufacturing ethanol from large quantities of ethyne found in natural gas.
Ethanal is then oxidized by air at 5 atmosphere pressure with Manganese (II)sulphate(VI) catalyst to form the ethanoic acid.
$\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{O}+[\mathrm{O}]--\mathrm{MnSO}_{4}$ Catalyst/5 atm pressure--> $\mathrm{CH}_{3} \mathrm{COOH}$ (Ethanal) (Oxygen from air)
(Ethanoic acid)

## (D) PHYSICAL AND CHEMICAL PROPERTIES OF ALKANOIC

## ACIDS. I.Physical properties of alkanoic acids

The table below shows some physical properties of alkanoic acids

| Alkanol | Melting <br> point $\left({ }^{\circ} \mathrm{C}\right)$ | Boiling <br> point $\left({ }^{\circ} \mathrm{C}\right)$ | Density $\left(\mathrm{gcm}^{-3}\right)$ | Solubility in <br> water |
| :--- | :--- | :--- | :--- | :--- |
| Methanoic acid | 18.4 | 101 | 1.22 | soluble |
| Ethanoic acid | 16.6 | 118 | 1.05 | soluble |
| Propanoic acid | -2.8 | 141 | 0.992 | soluble |
| Butanoic acid | -8.0 | 164 | 0.964 | soluble |
| Pentanoic acid | -9.0 | 187 | 0.939 | Slightly soluble |
| Hexanoic acid | -11 | 205 | 0.927 | Slightly soluble |
| Heptanoic acid | -3 | 223 | 0.920 | Slightly soluble |
| Octanoic acid | 11 | 239 | 0.910 | Slightly soluble |
| Nonanoic acid | 16 | 253 | 0.907 | Slightly soluble |
| Decanoic acid | 31 | 269 | 0.905 | Slightly soluble |

From the table note the following:
(i) Melting and boiling point decrease as the carbon chain increases due to increase in intermolecular forces of attraction between the molecules requiring more energy to separate the molecules.
(ii) The density decreases as the carbon chain increases as the intermolecular forces of attraction increases between the molecules making the molecule very close reducing their volume in unit mass.
(iii) Solubility decreases as the carbon chain increases as the soluble COOH end is shielded by increasing insoluble alkyl/hydrocarbon chain.
(iv) Like alkanols ,alkanoic acids exist as dimmers due to the hydrogen bonds within the molecule. i.e..

$\mathrm{R}_{1}$ and 2 are extensions of the molecule.
For ethanoic acid the extension is made up of $\mathbf{C H}_{3}$ - to make the structure;

For ethanoic acid the extension is made up of CH 3 - to make the structure;

Ethanoic acid has a higher melting/boiling point than ethanol .This is because ethanoic acid has two/more hydrogen bond than ethanol.

## II Chemical properties of alkanoic acids

The following experiments shows the main chemical properties of ethanoic (alkanoic) acid.

## (a)Effect on litmus papers

## Experiment

Dip both blue and red litmus papers in ethanoic acid. Repeat with a solution of succinic acid, citric acid, oxalic acid, tartaric acid and dilute nitric(V)acid. Sample observations

| Solution/acid | Observations/effect on litmus papers | Inference |
| :--- | :--- | :--- |
| Ethanoic acid | Blue litmus paper turn red <br> Red litmus paper remain red | $\mathrm{H}_{3} \mathrm{O}^{+} / \mathrm{H}^{+}(\mathrm{aq})$ ion |

| Succinic acid | Blue litmus paper turn red <br> Red litmus paper remain red | $\mathrm{H}_{3} \mathrm{O}^{+} / \mathrm{H}^{+}(\mathrm{aq})$ ion |
| :--- | :--- | :--- |
| Citric acid | Blue litmus paper turn red <br> Red litmus paper remain red | $\mathrm{H}_{3} \mathrm{O}^{+} / \mathrm{H}^{+}(\mathrm{aq})$ ion |
| Oxalic acid | Blue litmus paper turn red <br> Red litmus paper remain red | $\mathrm{H}_{3} \mathrm{O}^{+} / \mathrm{H}^{+}(\mathrm{aq})$ ion |
| Tartaric acid | Blue litmus paper turn red <br> Red litmus paper remain red | $\mathrm{H}_{3} \mathrm{O}^{+} / \mathrm{H}^{+}(\mathrm{aq})$ ion |
| Nitric(V)acid | Blue litmus paper turn red <br> Red litmus paper remain red | $\mathrm{H}_{3} \mathrm{O}^{+} / \mathrm{H}^{+}(\mathrm{aq})$ ion |

## Explanation

All acidic solutions contains $\mathrm{H}^{+} / \mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})$ ions. The $\mathrm{H}^{+} / \mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})$ ions is responsible for turning blue litmus paper/solution to red
(b) pH

## Experiment

Place 2 cm 3 of ethaoic acid in a test tube. Add 2 drops of universal indicator solution and determine its pH . Repeat with a solution of succinic acid, citric acid, oxalic acid, tartaric acid and dilute sulphuric (VI)acid.
Sample observations

| Solution/acid | pH | Inference |
| :--- | :--- | :--- |
| Ethanoic acid | $4 / 5 / 6$ | Weakly acidic |
| Succinic acid | $4 / 5 / 6$ | Weakly acidic |
| Citric acid | $4 / 5 / 6$ | Weakly acidic |
| Oxalic acid | $4 / 5 / 6$ | Weakly acidic |
| Tartaric acid | $4 / 5 / 6$ | Weakly acidic |
| Sulphuric(VI)acid | $\mathbf{1 / 2 / 3}$ | Strongly acidic |

## Explanations

Alkanoic acids are weak acids that partially/partly dissociate to release few $\mathrm{H}^{+}$ions in solution. The pH of their solution is thus $4 / 5 / 6$ showing they form weakly acidic solutions when dissolved in water.
All alkanoic acid dissociate to releases the " $\mathbf{H}$ " at the functional group in -COOH to form the alkanoate ion; $-\mathrm{COO}^{-}$
Mineral acids(Sulphuric(VI)acid, Nitric(V)acid and Hydrochloric acid) are strong acids that wholly/fully dissociate to release many $\mathrm{H}^{+}$ions in solution. The pH of their solution is thus $1 / 2 / 3$ showing they form strongly acidic solutions when dissolved in water.i.e
Examples

1. $\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{aq})$

$$
+\mathrm{H}^{+}(\mathrm{aq})
$$

(ethanoic acid) (e----> (ethanoate ion) (few $\mathrm{H}^{+}$ion)

## Experiment

Place about 4 cm 3 of ethanoic acid in a test tube. Put about 1 cm length of polished magnesium ribbon. Test any gas produced using a burning splint. Repeat with a solution of succinic acid, citric acid, oxalic acid, tartaric acid and dilute sulphuric (VI) acid.

Sample observations

| Solution/acid | Observations | Inference |
| :--- | :--- | :--- |
| Ethanoic acid | (i)effervescence, fizzing, bubbles <br> (ii)colourless gas produced that burn <br> with "pop" sound/explosion | $\mathrm{H}_{3} \mathrm{O}^{+} / \mathrm{H}^{+}(\mathrm{aq})$ ion |
| Succinic acid | (i)effervescence, fizzing, bubbles <br> (ii)colourless gas produced that burn <br> with "pop" sound/explosion | $\mathrm{H}_{3} \mathrm{O}^{+} / \mathrm{H}^{+}(\mathrm{aq})$ ion |
| Citric acid | (i)effervescence, fizzing, bubbles <br> (ii)colourless gas produced that burn <br> with "pop" sound/explosion | $\mathrm{H}_{3} \mathrm{O}^{+} / \mathrm{H}^{+}(\mathrm{aq})$ ion |
| Oxalic acid | (i)effervescence, fizzing, bubbles <br> (ii)colourless gas produced that burn <br> with "pop" sound/explosion | $\mathrm{H}_{3} \mathrm{O}^{+} / \mathrm{H}^{+}(\mathrm{aq})$ ion |
| Tartaric acid | (i)effervescence, fizzing, bubbles <br> (ii)colourless gas produced that burn <br> with "pop" sound/explosion | $\mathrm{H}_{3} \mathrm{O}^{+} / \mathrm{H}^{+}(\mathrm{aq})$ ion |

| Nitric(V)acid | (i)effervescence, fizzing, bubbles <br> (ii)colourless gas produced that burn <br> with "pop" sound/explosion | $\mathrm{H}_{3} \mathrm{O}^{+} / \mathrm{H}^{+}(\mathrm{aq})$ ion |
| :--- | :--- | :--- |

## Explanation

Metals higher in the reactivity series displace the hydrogen in all acids to evolve/produce hydrogen gas and form a salt. Alkanoic acids react with metals with metals to form alkanoates salt and produce/evolve hydrogen gas .Hydrogen extinguishes a burning splint with a pop sound/explosion. Only the "H"in the functional group - COOH is /are displaced and not in the alkyl hydrocarbon chain.

Alkanoic acid + Metal -> Alkanoate + Hydrogen gas. i.e. Examples

1. For a monovalent metal with monobasic acid
$2 \mathrm{R}-\mathrm{COOH}+2 \mathrm{M} \quad \rightarrow 2 \mathrm{R}-\mathrm{COOM}+2 \mathrm{H}_{2}(\mathrm{~g})$
2. For a divalent metal with monobasic acid

$$
2 \mathrm{R}-\mathrm{COOH}+\mathrm{M} \quad->(\mathrm{R}-\mathrm{COO})_{2} \mathbf{M}+\mathrm{H}_{2}(\mathrm{~g})
$$

3.For a divalent metal with dibasic acid

HOOC-R-COOH $+\mathrm{M} \quad->$ MOOC-R-COOM $+\mathrm{H}_{2}(\mathrm{~g})$
4.For a monovalent metal with dibasic acid

HOOC-R-COOH $+2 \mathrm{M} \quad$-> MOOC-R-COOM $+\mathrm{H}_{2}(\mathrm{~g})$
5 For mineral acids
(i)Sulphuric(VI)acid is a dibasic acid
$\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{M} \quad->\mathrm{M}_{2} \mathrm{SO}_{4}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g})$
$\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})+\mathrm{M} \quad->\quad \mathrm{MSO}_{4}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g})$
(ii)Nitric(V) and hydrochloric acid are monobasic acid
$\mathrm{HNO}_{3}(\mathrm{aq})+2 \mathrm{M}$-> $2 \mathrm{MNO}_{3}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g}) \mathbf{H N O}_{3}$
$(\mathrm{aq})+\mathrm{M}->\mathrm{M}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g})$

## Examples

1.Sodium reacts with ethanoic acid to form sodium ethanoate and produce.
hydrogen gas.
Caution: This reaction is explosive.
$\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{aq})+\mathrm{Na}(\mathrm{s})->\mathrm{CH}_{3} \mathrm{COONa}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g})$
(Ethanoic acid) (Sodium ethanoate)
2. Calcium reacts with ethanoic acid to form calcium ethanoate and produce. hydrogen gas.
$2 \mathrm{CH}_{3} \mathrm{COOH}(\mathrm{aq})+\mathrm{Ca}(\mathrm{s})->\left(\mathrm{CH}_{3} \mathrm{COO}\right) 2 \mathrm{Ca}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g})$
3.Sodium reacts with ethan-1,2-dioic acid to form sodium ethan-1,2-dioate and produce. hydrogen gas.
HOOC-COOH $+2 \mathrm{Na} \quad->\mathrm{NaOOC}-\mathrm{COONa}+\mathrm{H}_{2}(\mathrm{~g})$
(ethan-1,2-dioic acid) (sodium ethan-1,2-dioate)
Commercial name of ethan-1,2-dioic acid is oxalic acid. The salt is sodium oxalate.
4.Magnesium reacts with ethan-1,2-dioic acid to form magnesium ethan-1,2-dioate and produce. hydrogen gas.

HOOC-R-COOH $+\mathrm{Mg} \quad$-> ( OOC -COO$) \mathbf{M g}+\mathrm{H}_{2}(\mathrm{~g})$
(ethan-1,2-dioic acid) (magnesium ethan-1,2-dioate)
5.Magnesium reacts with
(i)Sulphuric(VI)acid to form Magnesium sulphate(VI)
$\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})+\mathrm{Mg} \quad->\mathrm{MgSO}_{4}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g})$
(ii)Nitric(V) and hydrochloric acid are monobasic acid
$2 \mathrm{HNO}_{3}(\mathrm{aq})+\mathrm{Mg}$-> M(NO 3$)_{2}(\mathrm{aq})+\mathrm{H}_{2}(\mathrm{~g})$

## (d)Reaction with hydrogen carbonates and carbonates Experiment

Place about 3 cm 3 of ethanoic acid in a test tube. Add about $0.5 \mathrm{~g} / 1 / 2$ spatula end full of sodium hydrogen carbonate/sodium carbonate. Test the gas produced using lime water. Repeat with a solution of succinic acid, citric acid, oxalic acid, tartaric acid and dilute sulphuric (VI) acid.
Sample observations

| Solution/acid | Observations | Inference |
| :--- | :--- | :--- |
| Ethanoic acid | (i)effervescence, fizzing, bubbles <br> (ii)colourless gas produced that forms a <br> white precipitate with lime water | $\mathrm{H}_{3} \mathrm{O}^{+} / \mathrm{H}^{+}(\mathrm{aq})$ ion |
| Succinic acid | (i)effervescence, fizzing, bubbles <br> (ii)colourless gas produced that forms a <br> white precipitate with lime water | $\mathrm{H}_{3} \mathrm{O}^{+} / \mathrm{H}^{+}(\mathrm{aq})$ ion |
| Citric acid | (i)effervescence, fizzing, bubbles <br> (ii)colourless gas produced that forms a <br> white precipitate with lime water | $\mathrm{H}_{3} \mathrm{O}^{+} / \mathrm{H}^{+}(\mathrm{aq})$ ion |
| Oxalic acid | (i)effervescence, fizzing, bubbles | $\mathrm{H}_{3} \mathrm{O}^{+} / \mathrm{H}^{+}(\mathrm{aq})$ ion |

|  | (ii)colourless gas produced that forms a <br> white precipitate with lime water |  |
| :--- | :--- | :--- |
| Tartaric acid | (i)effervescence, fizzing, bubbles <br> (ii)colourless gas produced that forms a <br> white precipitate with lime water | $\mathrm{H}_{3} \mathrm{O}^{+} / \mathrm{H}^{+}($aq $)$ion |
| Nitric(V)acid | (i)effervescence, fizzing, bubbles <br> (ii)colourless gas produced that forms a <br> white precipitate with lime water | $\mathrm{H}_{3} \mathrm{O}^{+} / \mathrm{H}^{+}($aq $)$ion |

All acids react with hydrogen carbonate/carbonate to form salt , water and evolve/produce bubbles of carbon(IV)oxide and water.
Carbon(IV)oxide forms a white precipitate when bubbled in lime water/extinguishes a burning splint.
Alkanoic acids react with hydrogen carbonate/carbonate to form alkanoates ,water and evolve/produce bubbles of carbon(IV)oxide and water.

Alkanoic acid + hydrogen carbonate -> alkanoate + water + carbon(IV)oxide
Alkanoic acid + carbonate -> alkanoate + water + carbon(IV)oxide Examples

1. Sodium hydrogen carbonate reacts with ethanoic acid to form sodium ethanoate ,water and carbon(IV)oxide gas.
$\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{aq})+\mathrm{NaHCO}_{3}(\mathrm{~s})->\mathrm{CH}_{3} \mathrm{COONa}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g})$ (Ethanoic acid) (Sodium ethanoate)
2.Sodium carbonate reacts with ethanoic acid to form sodium ethanoate ,water and carbon(IV)oxide gas.

$$
\underset{\text { (Ethanoic acid) }}{2 \mathrm{CH}_{3} \mathrm{COOH}(\mathrm{aq})}+\underset{\text { (Sodium ethanoate) }}{\mathrm{Na}_{2} \mathrm{CO}_{3}(\mathrm{~s})} \underset{\text { - }}{->} 2 \mathrm{CH}_{3} \mathrm{COONa}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g})
$$

3.Sodium carbonate reacts with ethan-1,2-dioic acid to form sodium ethanoate ,water and carbon(IV)oxide gas.
$\mathrm{HOOC}-\mathrm{COOH}+\mathrm{Na}_{2} \mathrm{CO}_{3}(\mathrm{~s}) \quad->\mathrm{NaOOC}-\mathrm{COONa}+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g})$ (ethan-1,2-dioic acid) (sodium ethan-1,2-dioate)
4.Sodium hydrogen carbonate reacts with ethan-1,2-dioic acid to form sodium ethanoate, water and carbon(IV)oxide gas.
$\mathrm{HOOC}_{-\mathrm{COOH}}+2 \mathrm{NaHCO}_{3}(\mathrm{~s})$-> $\mathrm{NaOOC}-\mathrm{COONa}+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+2 \mathrm{CO}_{2}(\mathrm{~g})$ (ethan-1,2-dioic acid) (sodium ethan-1,2-dioate)

## (e)Esterification

## Experiment

Place 4 cm 3 of ethanol acid in a boiling tube.
Add equal volume of ethanoic acid. To the mixture, add 2 drops of concentrated sulphuric(VI)acid carefully. Warm/heat gently on Bunsen flame.
Pour the mixture into a beaker containing 50 cm 3 of water. Smell the products. Repeat with a solution of succinic acid, citric acid, oxalic acid, tartaric acid and dilute sulphuric (VI) acid.

Sample observations

| Solution/acid | Observations |
| :--- | :--- |
| Ethanoic acid | Sweet fruity smell |
| Succinic acid | Sweet fruity smell |
| Citric acid | Sweet fruity smell |
| Oxalic acid | Sweet fruity smell |
| Tartaric acid | Sweet fruity smell |
| Dilute sulphuric(VI)acid | No sweet fruity smell |

## Explanation

Alkanols react with alkanoic acid to form the sweet smelling homologous series of esters and water.The reaction is catalysed by concentrated sulphuric(VI)acid in the laboratory but naturally by sunlight /heat.Each ester has a characteristic smell derived from the many possible combinations of alkanols and alkanoic acids.

$$
\text { Alkanol } \quad+\text { Alkanoic acids } \quad->\text { Ester }+\quad \text { water }
$$ Esters derive their names from the alkanol first then alkanoic acids. The alkanol "becomes" an alkyl group and the alkanoic acid "becomes" alkanoate hence alkylalkanoate. e.g.

| Ethanol | + | Ethanoic acid | $->$ | Ethylethanoate | + Water |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Ethanol | + | Propanoic acid | $->$ | Ethylpropanoate | + Water |
| Ethanol | + | Methanoic acid | $->$ | Ethylmethanoate | + Water |
| Ethanol | + | butanoic acid | $->$ | Ethylbutanoate | + Water |
| Propanol | + | Ethanoic acid | $->$ | Propylethanoate | + Water |
| Methanol | + | Ethanoic acid | $->$ | Methyethanoate | + Water |
| Methanol | + | Decanoic acid | $->$ | Methyldecanoate | + Water |
| Decanol | + | Methanoic acid | $->$ | Decylmethanoate | + Water |

During the formation of the ester, the " O " joining the alkanol and alkanoic acid comes from the alkanol.

$$
\mathrm{R}_{1}-\mathrm{COOH}+\mathrm{R}_{2}-\mathrm{OH} \rightarrow \mathrm{R}_{1}-\mathrm{COO}-\mathbf{R}_{2}+\mathbf{H}_{2} \mathbf{O}
$$

Examples

1. Ethanol reacts with ethanoic acid to form the ester ethyl ethanoate and water.

Ethanol + Ethanoic acid --Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$-->Ethylethanoate + Water
$\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(\mathrm{l})+\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{l})$--Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$--> $\mathrm{CH}_{3} \mathrm{COO} \mathrm{C}_{2} \mathrm{H}_{5}(\mathbf{a q})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{l})+\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{l})-$--Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$--> $\mathrm{CH}_{3} \mathrm{COOCH}_{2} \mathrm{CH}_{3}(\mathbf{a q})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
2. Ethanol reacts with propanoic acid to form the ester ethylpropanoate and water.

Ethanol + Propanoic acid --Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$-->Ethylethanoate + Water $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(\mathrm{l})+\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COOH}(\mathrm{l})$--Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}-->\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COO} \mathrm{C} 2 \mathrm{H}_{5}(\mathbf{a q})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{l})+\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COOH}(1)$--Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$--> $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COOCH}_{2} \mathrm{CH}_{3}(\mathbf{a q})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
3. Methanol reacts with ethanoic acid to form the ester methyl ethanoate and water.

Methanol + Ethanoic acid --Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$-->Methylethanoate + Water
$\mathrm{CH}_{3} \mathrm{OH}(\mathrm{l})+\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{l})$--Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$--> $\mathrm{CH}_{3} \mathrm{COO} \mathrm{CH}_{3}(\mathbf{a q})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
4. Methanol reacts with propanoic acid to form the ester methyl propanoate and water.

Methanol + propanoic acid --Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$-->Methylpropanoate + Water $\mathrm{CH}_{3} \mathrm{OH}(\mathrm{l})+\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COOH}(\mathrm{l})--\mathrm{Conc} . \mathrm{H}_{2} \mathrm{SO}_{4}-->\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COO} \mathrm{CH}_{3}(\mathbf{a q})+\mathrm{H}_{2} \mathrm{O}(1)$
5. Propanol reacts with propanoic acid to form the ester propylpropanoate and water.

Propanol + Propanoic acid --Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$-->Ethylethanoate + Water $\mathrm{C}_{3} \mathrm{H}_{7} \mathrm{OH}(\mathrm{l})+\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COOH}_{(1)}$--Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}-->\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COO} \mathrm{C} 3 \mathrm{H}_{7}(\mathbf{a q})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{l})+\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COOH}(\mathrm{l})$--Conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$-->
$\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COOCH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}(\mathbf{a q})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$

## C. DETERGENTS

Detergents are cleaning agents that improve the cleaning power /properties of water.A detergent therefore should be able to:
(i)dissolve substances which water can not e.g grease ,oil, fat (ii)be washed away after cleaning.
There are two types of detergents:
(a)Soapy detergents
(b)Soapless detergents

## (a) SOAPY DETERGENTS

Soapy detergents usually called soap is long chain salt of organic alkanoic acids.Common soap is sodium octadecanoate .It is derived from reacting concentrated sodium hydroxide solution with octadecanoic acid(18 carbon alkanoic acid) i.e.
Sodium hydroxide + octadecanoic acid -> Sodium octadecanoate + water $\mathrm{NaOH}(\mathrm{aq})+\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right){ }_{16} \mathrm{COOH}(\mathrm{aq})->\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right){ }_{16} \mathrm{COO}^{-} \mathrm{Na}^{+}(\mathrm{aq})+\mathrm{H}_{2}$ $\mathrm{O}(\mathrm{l})$ Commonly ,soap can thus be represented ;

$$
\mathrm{R}-\mathrm{COO}^{-} \mathbf{N a}^{+} \text {where; }
$$

R is a long chain alkyl group and $-\mathrm{COO}^{-} \mathbf{N a}^{+}$is the alkanoate ion.
In a school laboratory and at industrial and domestic level,soap is made by reacting concentrated sodium hydroxide solution with esters from (animal) fat and oil. The process of making soap is called saponification. During saponification ,the ester is hydrolyzed by the alkali to form sodium salt /soap and glycerol/propan-1,2,3-triol is produced.

Fat/oil(ester)+sodium/potassium hydroxide->sodium/potassium salt(soap)+ glycerol
Fats/Oils are esters with fatty acids and glycerol parts in their

When boiled with concentrated sodium hydroxide solution NaOH ;
(i) NaOH ionizes/dissociates into $\mathbf{N a}^{+}$and $\mathbf{O H}^{-}$ions (ii)fat/oil split into three $\mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}^{-}$and one $\mathrm{CH}_{2} \mathrm{CH} \mathrm{CH}_{2}$
(iii) the three $\mathbf{N a}^{+}$combine with the three $\mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}^{-}$to form the salt $\mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}^{-} \mathrm{Na}^{+}$
(iv)the three $\mathbf{O H}^{-}$ions combine with the $\mathrm{CH}_{2} \mathrm{CH} \mathrm{CH}_{2}$ to form an alkanol
with three functional groups $\mathrm{CH}_{2} \mathbf{O H} \mathrm{CH} \mathbf{O H ~ C H} 2 \mathbf{~} \mathbf{O H}$ (propan-1,2,3-triol)
$\mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}_{\mathbf{C H}}^{2}$

$\mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO} \mathrm{CH}_{2}$ Ester

Alkali
Soap

Generally:
C H COO

During this process a little sodium chloride is added to precipitate the soap by reducing its solubility. This is called salting out.
The soap is then added colouring agents ,perfumes and herbs of choice.

## School laboratory preparation of soap

Place about 40 g of fatty (animal fat)beef/meat in 100 cm 3 beaker .Add about 15 cm 3 of 4.0 M sodium hydroxide solution. Boil the mixture for about 15 minutes.Stir the mixture .Add about 5.0 cm 3 of distilled water as you boil to make up for evaporation. Boil for about another 15 minutes.Add about four spatula end full of pure sodium chloride crystals. Continue stirring for another five minutes. Allow to cool. Filter of
/decant and wash off the residue with distilled water .Transfer the clean residue into a dry beaker. Preserve.

## The action of soap

Soapy detergents:
(i)act by reducing the surface tension of water by forming a thin layer on top of the water.
(ii)is made of a non-polar alkyl/hydrocarbon tail and a polar - $\mathrm{COO}^{-} \mathrm{Na}^{+}$ head. The non-polar alkyl /hydrocarbon tail is hydrophobic (water hating) and thus does not dissolve in water .It dissolves in non-polar solvent like grease, oil and fat. The polar $-\mathrm{COO}^{-} \mathrm{Na}^{+}$head is hydrophilic (water loving) and thus dissolve in water. When washing with soapy detergent, the non-polar tail of the soapy detergent surround/dissolve in the dirt on the garment/grease/oil while the polar head dissolve in water.
Through mechanical agitation/stirring/sqeezing/rubbing/beating/kneading, some grease is dislodged/lifted of the surface of the garment. It is immediately surrounded by more soap molecules It float and spread in the water as tiny droplets that scatter light in form of emulsion making the water cloudy and shinny. It is removed from the garment by rinsing with fresh water.The repulsion of the soap head prevent /ensure the droplets do not mix.Once removed, the dirt molecules cannot be redeposited back because it is surrounded by soap molecules.

## Advantages and disadvantages of using soapy detergents

Soapy detergents are biodegradable. They are acted upon by bacteria and rot.They thus do not cause environmental pollution. Soapy detergents have the diadvatage in that:
(i)they are made from fat and oils which are better eaten as food than make soap.
(ii)forms an insoluble precipitate with hard water called scum. Scum is insoluble calcium octadecanoate and Magnesium octadecanoate formed when soap reacts with $\mathrm{Ca}^{2+}$ and $\mathrm{Mg}^{2+}$ present in hard water.
Chemical equation

$$
2 \mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}^{-} \mathbf{N a}^{+}(\mathrm{aq})+\mathrm{Ca}^{2+}(\mathrm{aq})->\quad\left(\mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}^{-}\right) \mathrm{Ca}^{2+}(\mathrm{s})+\mathbf{2} \mathbf{N a}^{+}(\mathrm{aq})
$$

(insoluble Calcium octadecanote/scum)

$$
2 \mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}^{-} \mathrm{Na}^{+}(\mathrm{aq})+\mathrm{Mg}^{2+}(\mathrm{aq}) \quad->\quad\left(\mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}^{-}\right) \mathrm{Mg}^{2+}(\mathrm{s})+2 \mathrm{Na}^{+}(\mathrm{aq})
$$

(insoluble Magnesium octadecanote/scum)

This causes wastage of soap.
Potassium soaps are better than Sodium soap. Potassium is more expensive than sodium and thus its soap is also more expensive.

## (b)SOAPLESS DETERGENTS

Soapless detergent usually called detergent is a long chain salt fromed from byproducts of fractional distillation of crude oil.Commonly used soaps include:
(i)washing agents
(ii)toothpaste
(iii)emulsifiers/wetting agents/shampoo

Soapless detergents are derived from reacting:
(i)concentrated sulphuric(VI)acid with a long chain alkanol e.g.

Octadecanol(18 carbon alkanol) to form alkyl hydrogen sulphate(VI)
Alkanol + Conc sulphuric(VI)acid -> alkyl hydrogen sulphate(VI) + Water R
$-\mathrm{OH}+\mathrm{H}_{2} \mathrm{SO}_{4}->\mathrm{R}-\mathrm{O}-\mathrm{SO}_{3} \mathrm{H}+\mathrm{H}_{2} \mathrm{O}$
(ii)the alkyl hydrogen sulphate(VI) is then neutralized with sodium/potassium hydroxide to form sodium/potassium alkyl hydrogen sulphate(VI) Sodium/potassium alkyl hydrogen sulphate(VI) is the soapless detergent.

Example
Step I : Reaction of Octadecanol with Conc. $\mathbf{H}_{2} \mathrm{SO}_{4}$
$\mathrm{C}_{17} \mathrm{H}_{35} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{SO}_{4}->\mathrm{C}_{17} \mathrm{H}_{35} \mathrm{CH}_{2}-\mathbf{O}-\mathbf{S O}_{3} \quad{ }^{-} \mathbf{H}^{+}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
octadecanol + sulphuric(VI)acid -> Octadecyl hydrogen sulphate(VI) + water
Step II: Neutralization by an alkali
$\mathrm{C}_{17} \mathrm{H}_{35} \mathrm{CH}_{2}-\mathbf{O}-\mathbf{S O}_{3}{ }^{-} \mathbf{H}^{+}(\mathrm{aq})+\mathrm{NaOH} \quad->\mathrm{C}_{17} \mathrm{H}_{35} \mathrm{CH}_{2} \mathbf{- O}-\mathbf{S O}_{3}{ }^{-} \mathbf{N a}^{+}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
Octadecyl hydrogen + sodium/potassium -> sodium/potassium octadecyl+Water sulphate(VI)
hydroxide
hydrogen sulphate(VI)

## School laboratory preparation of soapless detergent

Place about 20 g of olive oil in a 100 cm 3 beaker. Put it in a trough containing ice cold water.
Add dropwise carefully 18 M concentrated sulphuric(VI)acid stirring continuously into the olive oil until the oil turns brown. Add 30 cm 3 of 6 M sodium hydroxide solution.Stir.This is a soapless detergent.

## The action of soapless detergents

The action of soapless detergents is similar to that of soapy detergents.The soapless detergents contain the hydrophilic head and a long hydrophobic tail. i.e.

<br><br>(long hydrophobic /non-polar alkyl tail) (hydrophilic/polar/ionic head)

The tail dissolves in fat/grease/oil while the ionic/polar/ionic head dissolves in water.
The tail stick to the dirt which is removed by the attraction of water molecules and the polar/ionic/hydrophilic head by mechanical agitation /squeezing/kneading/ beating/rubbing/scrubbing/scatching.
The suspended dirt is then surrounded by detergent molecules and repulsion of the anion head preventing the dirt from sticking on the material garment.
The tiny droplets of dirt emulsion makes the water cloudy. On rinsing the cloudy emulsion is washed away.

## Advantages and disadvantages of using soapless detergents

Soapless detergents are non-biodegradable unlike soapy detergents.
They persist in water during sewage treatment by causing foaming in rivers ,lakes and streams leading to marine /aquatic death. Soapless detergents have the advantage in that they:
(i)do not form scum with hard water.
(ii)are cheap to manufacture/buying
(iii)are made from petroleum products but soapis made from fats/oil for human consumption.

## Sample revision questions

1. Study the scheme below

## (a)Identify the process

Saponification
(b)Fats and oils are esters. Write the formula of the a common structure of ester

(c)Write a balanced equation for the reaction taking place during boiling

Ester

Alkali
Soap

glycerol
(d)Give the IUPAC name of:
(i)Residue $\mathbf{X}$

Potassium octadecanoate
(ii)Filtrate $\mathbf{Y}$

Propan-1,2,3-triol
(e)Give one use of fitrate $Y$

Making paint
(f) What is the function of sodium chloride

To reduce the solubility of the soap hence helping in precipitating it out
(g)Explain how residue X helps in washing.

Has a non-polar hydrophobic tail that dissolves in dirt/grease /oil/fat Has a polar /ionic hydrophilic head that dissolves in water.

From mechanical agitation,the dirt is plucked out of the garment and surrounded by the tail end preventing it from being deposited back on the garment.
(h)State one:
(i)advantage of continued use of residue X on the environment

Is biodegradable and thus do not pollute the environment
(ii)disadvantage of using residue $X$

Uses fat/oil during preparation/manufacture which are better used for human consumption.
(i)Residue X was added dropwise to some water.The number of drops used before lather forms is as in the table below.

|  | Water sample |  |  |
| :--- | :--- | :--- | :--- |
|  | A | B | C |
| Drops of residue $X$ | 15 | 2 | 15 |
| Drops of residue $X$ in boiled water | 2 | 2 | 15 |

(i)State and explain which sample of water is:

## I. Soft

Sample B .Very little soap is used and no effect on amount of soap even on boiling/heating.
II. Permanent hard

Sample C . A lot of soap is used and no effect on amount of soap even on boiling/heating. Boiling does not remove permanent hardness of water.

## III. Temporary hard

Sample A. A lot of soap is used before boiling. Very little soap is used on boiling/heating. Boiling remove temporary hardness of water.
(ii)Write the equation for the reaction at water sample $\mathbf{C}$.

Chemical equation
$\overline{2 \mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}^{-} \mathrm{K}^{+}}(\mathrm{aq})+\mathrm{CaSO}_{4}(\mathrm{aq})->\quad\left(\mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}^{-}\right) \mathrm{Ca}^{2+}(\mathrm{s})+\mathrm{K}_{2} \mathrm{SO}_{4}(\mathrm{aq})$ (insoluble Calcium octadecanote/scum)
Ionic equation
$2 \mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}^{-} \mathrm{K}^{+}(\mathrm{aq})+\mathrm{Ca}^{2+}(\mathrm{aq}) \quad->\quad\left(\mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}^{-}\right) \mathrm{Ca}^{2+}(\mathrm{s})+\mathbf{2} \mathbf{K}^{+}(\mathrm{aq})$ (insoluble Calcium octadecanote/scum)

Chemical equation
$2 \mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}^{-} \mathrm{K}^{+}(\mathrm{aq})+\mathrm{MgSO}_{4}(\mathrm{aq}) \quad->\left(\mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}^{-}\right) \mathrm{Mg}^{2+}(\mathrm{s})+\mathrm{K}_{2} \mathrm{SO}_{4}(\mathrm{aq})$
(insoluble Calcium octadecanote/scum)
Ionic equation
$2 \mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}^{-} \mathrm{K}^{+}(\mathrm{aq})+\mathrm{Mg}^{2+}(\mathrm{aq}) \quad$->
$\left(\mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}^{-}\right) \mathrm{Mg}^{2+}(\mathrm{s})+\mathbf{2} \mathbf{K}^{+}(\mathrm{aq})$
(insoluble Magnesium octadecanote/scum)
(iii) Write the equation for the reaction at water sample $\mathbf{A}$ before boiling.

Chemical equation

$$
2 \mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}^{-} \mathrm{K}^{+}(\mathrm{aq})+\mathrm{Ca}\left(\mathrm{HCO}_{3}\right)(\mathrm{aq})->\left(\mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}^{-}\right) \mathrm{Ca}^{2+}(\mathrm{s})+2 \mathrm{KHCO}_{3}(\mathrm{aq})
$$

(insoluble Calcium octadecanote/scum)
Ionic equation
$\overline{2 \mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}^{-}} \mathrm{K}^{+}(\mathrm{aq})+\mathrm{Ca}^{2+}(\mathrm{aq})->$
$\left(\mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}^{-}\right) \mathrm{Ca}^{2+}(\mathrm{s})+2 \mathrm{~K}^{+}(\mathrm{aq})$
(insoluble Calcium octadecanote/scum)
Chemical equation
$2 \mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}^{-} \mathrm{K}^{+}(\mathrm{aq})+\mathrm{Mg}\left(\mathrm{HCO}_{3}\right)(\mathrm{aq})->\left(\mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}^{-}\right) \mathrm{Mg}^{2+}(\mathrm{s})+2 \mathrm{KHCO}_{3}(\mathrm{aq})$ (insoluble Calcium octadecanote/scum)
Ionic equation
$2 \mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}^{-} \mathrm{K}^{+}(\mathrm{aq})+\mathrm{Mg}^{2+}(\mathrm{aq})->\quad\left(\mathrm{C}_{17} \mathrm{H}_{35} \mathrm{COO}^{-}\right) \mathrm{Mg}^{2+}(\mathrm{s})+2 \mathrm{~K}^{+}(\mathrm{aq})$
(insoluble Magnesium octadecanote/scum)

## (iv)Explain how water becomes hard

Natural or rain water flowing /passing through rocks containing calcium (chalk, gypsum, limestone) and magnesium compounds (dolomite)dissolve them to form soluble $\mathrm{Ca}^{2+}$ and $\mathrm{Mg}^{2+}$ ions that causes water hardness.
(v)State two useful benefits of hard water -

Used in bone and teeth formation
-Coral polyps use hard water to form coral
reefs -Snails use hard water to make their shells
2.Study the scheme below and use it to answer the questions that follow.

(a)Identify :
(i)brown solid A

Alkyl hydrogen sulphate(VI)
(ii)substance $B$

Sodium alkyl hydrogen sulphate(VI)
(b)Write a general formula of:
(i)Substance A.

(ii)Substance B

R-O-S O3-Na+

(c)State one
(i) advantage of continued use of substance $B$
-Does not form scum with hard water -Is cheap to make
-Does not use food for human as a raw material.
(ii)disadvantage of continued use of substance $B$.

Is non-biodegradable therefore do not pollute the environment
(d)Explain the action of $\mathbf{B}$ during washing.

Has a non-polar hydrocarbon long tail that dissolves in dirt/grease/oil/fat. Has a polar/ionic hydrophilic head that dissolves in water
Through mechanical agitation the dirt is plucked /removed from the garment and surrounded by the tail end preventing it from being deposited back on the garment.
(e) Ethene was substituted for olive oil in the above process. Write the equation and name of the new products $A$ and $B$.

$$
\begin{array}{clll}
\frac{\text { Product A }}{\text { Ethene }} & +\begin{array}{l}
\text { Sulphuric(VI)acid }
\end{array} & \rightarrow & \text { Ethyl hydrogen sulphate(VI) } \\
\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}_{2} & +\quad \mathrm{H}_{2} \mathrm{SO}_{4} & \rightarrow & \mathrm{H}_{3} \mathrm{C}-\mathrm{CH}_{2}-\mathrm{O}-\mathrm{SO}_{3} \mathrm{H}
\end{array}
$$

Product B
Ethyl hydrogen sulphate(VI) + sodium hydroxide -> sodium Ethyl +Water hydrogen sulphate(VI)
$\mathrm{H}_{3} \mathrm{C}-\mathrm{CH}_{2}-\mathrm{O}-\mathrm{SO}_{3} \mathrm{H}+\mathrm{NaOH} \rightarrow \mathrm{H}_{3} \mathrm{C}-\mathrm{CH}_{2}-\mathrm{O}_{-}-\mathrm{SO}_{3}-\mathrm{Na}^{+}+\mathrm{H}_{2} \mathrm{O}$
(f)Ethanol can also undergo similar reactions forming new products A and B.Show this using a chemical equation.
Product A
$\begin{array}{cll}\text { Ethanol+ } & \text { Sulphuric(VI)acid } & \\ \mathrm{H}_{3} \mathrm{C}-\mathrm{CH}_{2} \mathrm{OH} & +\quad \text { - Ethyl hydrogen sulphate(VI) + water } \\ \mathrm{H}_{2} \mathrm{SO}_{4} & & \rightarrow \mathrm{H}_{3} \mathrm{C}-\mathrm{CH}_{2}-\mathrm{O}-\mathrm{SO}_{3} \mathrm{H}+\mathrm{H}_{2} \mathrm{O}\end{array}$

Product B
Ethyl hydrogen sulphate(VI) + sodium hydroxide -> sodium Ethyl + Water hydrogen sulphate(VI)
$\mathrm{H}_{3} \mathrm{C}-\mathrm{CH}_{2}-\mathrm{O}-\mathrm{SO}_{3} \mathrm{H}+\mathrm{NaOH} \rightarrow \mathrm{H}_{3} \mathrm{C}-\mathrm{CH}_{2}-\mathrm{O}-\mathrm{SO}_{3} \mathrm{Na}^{+}+\mathrm{H}_{2} \mathrm{O}$
3.Below is part of a detergent
$\mathrm{H}_{3} \mathrm{C}-\left(\mathrm{CH}_{2}\right)_{16}-\mathrm{O}-\mathrm{SO}_{3}{ }^{-} \mathrm{K}^{+}$(a) Write the
formular of the polar and non-polar end
Polar end
$\mathrm{H}_{3} \mathrm{C}-\left(\mathrm{CH}_{2}\right)_{16}-$
Non-polar end

$$
-\mathrm{O}-\mathrm{SO}_{3}{ }^{-} \mathrm{K}^{+}
$$

(b)Is the molecule a soapy or saopless detergent?

Soapless detergent
(c)State one advantage of using the above detergent
-does not form scum with hard water
-is cheap to manufacture
4.The structure of a detergent is

a)Write the molecular formula of the detergent.
b) What type of detergent is represented by the formula?

## Soapy detergent

c) When this type of detergent is used to wash linen in hard water, spots (marks) are left on the linen. Write the formula of the substance responsible for the spots
$\left.\left(\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{12} \mathrm{COO}^{-}\right)_{2} \mathrm{Ca}^{\mathbf{2 +}} \quad / \mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{12} \mathrm{COO}^{-}\right)_{2} \mathrm{Mg}^{2+}$

## D. POLYMERS AND FIBRES

Polymers and fibres are giant molecules of organic compounds. Polymers and fibres are formed when small molecules called monomers join together to form large molecules called polymers at high temperatures and pressures. This process is called polymerization.
Polymers and fibres are either:
(a)Natural polymers and fibres
(b)Synthetic polymers and fibres

Natural polymers and fibres are found in living things(plants and animals) Natural polymers/fibres include:
-proteins/polypeptides making amino acids in animals
-cellulose that make cotton,wool,paper and silk -
Starch that come from glucose -Fats and oils
-Rubber from latex in rubber trees.
Synthetic polymers and fibres are man-made. They include:
-polyethene
-polychloroethene
-polyphenylethene(polystyrene)
-Terylene(Dacron)
-Nylon-6,6
-Perspex(artificial glass)
Synthetic polymers and fibres have the following characteristic advantages over natural polymers

1. They are light and portable
2. They are easy to manufacture.
3. They can easily be molded into shape of choice.
4. They are resistant to corrosion, water, air, acids, bases and salts.
5. They are comparatively cheap, affordable, colourful and aesthetic

Synthetic polymers and fibres however have the following disadvantages over natural polymers

1. They are non-biodegradable and hence cause environmental pollution during disposal
2. They give out highly poisonous gases when burnt like chlorine/carbon(II)oxide
3. Some on burning produce Carbon(IV)oxide. Carbon(IV)oxide is a green house gas that cause global warming.
4. Compared to some metals, they are poor conductors of heat,electricity and have lower tensile strength.
5. 

To reduce environmental pollution from synthetic polymers and fibres, the followitn methods of disposal should be used:
1.Recycling: Once produced all synthetic polymers and fibres should be recycled to a new product. This prevents accumulation of the synthetic polymers and fibres in the environment.
2.Production of biodegradable synthetic polymers and fibres that rot away.

There are two types of polymerization:
(a)addition polymerization
(b)condensation polymerization

## (a)addition polymerization

Addition polymerization is the process where a small unsaturated monomer (alkene ) molecule join together to form a large saturated molecule. Only alkenes undergo addition polymerization.

Addition polymers are named from the alkene/monomer making the polymer and adding the prefix "poly" before the name of monomer to form a polyalkene

During addition polymerization
(i)the double bond in alkenes break
(ii)free radicals are formed
(iii)the free radicals collide with each other and join to form a larger molecule. The more collisions the larger the molecule.

## Examples of addition polymerization

## 1.Formation of Polyethene

Polyethene is an addition polymer formed when ethene molecule/monomer join together to form a large molecule/polymer at high temperatures and pressure. During polymerization:
(i)many molecules are brought nearer to each other by the high pressure(which reduces the volume occupied by reacting paticles)

(ii)the double bond joining the ethane molecule break to free readicals

Ethene radical + Ethene radical + Ethene radical + Ethene radical + ...
(iii)the free radicals collide with each other and join to form a larger molecule

Lone pair of electrons can be used to join more monomers to form longer polyethene.
Polyethene molecule can be represented as:

Since the molecule is a repetition of one monomer, then the polymer is:

Where n is the number of monomers in the polymer. The number of monomers in the polymer can be determined from the molar mass of the polymer and monomer from the relationship:
Number of monomers/repeating units in monomer $=$ Molar mass polymer
Molar mass monomer

## Examples

Polythene has a molar mass of 4760 . Calculate the number of ethene molecules in the polymer( $\mathrm{C}=12.0, \mathrm{H}=1.0$ )
Number of monomers/repeating units in polyomer = Molar mass polymer
Molar mass monomer
$\Rightarrow$ Molar mass ethene $\left(\mathrm{C}_{2} \mathrm{H}_{4}\right)=28$ Molar mass polyethene $=4760$
Substituting $\quad \frac{4760}{28} \quad=\quad \underline{170 \text { ethene molecules }}$
The commercial name of polyethene is polythene. It is an elastic, tough, transparent and durable plastic. Polythene is used:
(i)in making plastic bag
(ii)bowls and plastic bags
(iii)packaging materials

## 2.Formation of Polychlorethene

Polychloroethene is an addition polymer formed when chloroethene molecule/monomer join together to form a large molecule/polymer at high temperatures and pressure.
During polymerization:
(i)many molecules are brought nearer to each other by the high pressure(which reduces the volume occupied by reacting particles)

chloroethene + chloroethene + chloroethene + chloroethene $+\ldots$
(ii)the double bond joining the chloroethene molecule break to free radicals

(iii)the free radicals collide with each other and join to form a larger molecule

Lone pair of electrons can be used to join more monomers to form longer polychloroethene.
Polychloroethene molecule can be represented as:

## H Cl H Cl H Cl H Cl

Since the molecule is a repetition of one monomer, then the polymer is:

## Examples

Polychlorothene has a molar mass of 4760.Calculate the number of chlorethene molecules in the polymer ( $\mathrm{C}=12.0, \mathrm{H}=1.0, \mathrm{Cl}=35.5$ )
Number of monomers/repeating units in monomer $=\underline{\text { Molar mass polymer }}$
Molar mass monomer
$\Rightarrow$ Molar mass ethene $\left(\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{Cl}\right)=62.5$ Molar mass polyethene $=4760$
Substituting $\frac{4760}{62.5}=\underline{77.16}=>\underline{77 \text { polychloroethene molecules(whole number) }}$
The commercial name of polychloroethene is polyvinylchloride(PVC). It is a tough, non-transparent and durable plastic. PVC is used:
(i)in making plastic rope
(ii)water pipes
(iii)crates and boxes
3.Formation of Polyphenylethene

Polyphenylethene is an addition polymer formed when phenylethene molecule/monomer join together to form a large molecule/polymer at high temperatures and pressure.
During polymerization:
(i)many molecules are brought nearer to each other by the high pressure(which reduces the volume occupied by reacting particles)

phenylethene + phenylethene + phenylethene + phenylethene + ...
(ii)the double bond joining the phenylethene molecule break to free radicals

(iii)the free radicals collide with each other and join to form a larger molecule

Lone pair of electrons can be used to join more monomers to form longer polyphenylethene.
Polyphenylethene molecule can be represented as:

Since the molecule is a repetition of one monomer, then the polymer is:

## Examples

Polyphenylthene has a molar mass of 4760.Calculate the number of phenylethene molecules in the polymer( $\mathbf{C = 1 2 . 0}, \mathrm{H}=1.0$, )
Number of monomers/repeating units in monomer = Molar mass polymer
Molar mass monomer
=> Molar mass ethene $\left(\mathrm{C}_{8} \mathrm{H}_{8}\right)=104$ Molar mass polyethene $=4760$
Substituting $\underline{4760}=\underline{45.7692}=>\underline{45}$ polyphenylethene molecules(whole number)

The commercial name of polyphenylethene is polystyrene. It is a very light durable plastic. Polystyrene is used:
(i)in making packaging material for carrying delicate items like computers, radion,calculators.
(ii)ceiling tiles
(iii)clothe linings

## 4.Formation of Polypropene

Polypropene is an addition polymer formed when propene molecule/monomer join together to form a large molecule/polymer at high temperatures and pressure.
During polymerization:
(i)many molecules are brought nearer to each other by the high pressure(which reduces the volume occupied by reacting particles)

(ii)the double bond joining the phenylethene molecule break to free radicals

(iii)the free radicals collide with each other and join to form a larger molecule

Lone pair of electrons can be used to join more monomers to form longer propene. propene molecule can be represented as:

Since the molecule is a repetition of one monomer, then the polymer is:

Examples
Polypropene has a molar mass of 4760. Calculate the number of propene molecules in the polymer ( $\mathrm{C}=12.0, \mathrm{H}=1.0$, )
Number of monomers/repeating units in monomer $=\underline{\text { Molar mass polymer }}$
Molar mass monomer
=> Molar mass propene $\left(\mathrm{C}_{3} \mathrm{H}_{8}\right)=44$ Molar mass polyethene $=4760$
Substituting $\underline{4760}=\underline{108.1818}=>\underline{108}$ propene molecules $($ whole number) 44
The commercial name of polyphenylethene is polystyrene. It is a very light durable plastic. Polystyrene is used:
(i)in making packaging material for carrying delicate items like computers, radion, calculators.
(ii)ceiling tiles
(iii)clothe linings

## 5.Formation of Polytetrafluorothene

Polytetrafluorothene is an addition polymer formed when tetrafluoroethene molecule/monomer join together to form a large molecule/polymer at high temperatures and pressure.
During polymerization:
(i)many molecules are brought nearer to each other by the high pressure(which reduces the volume occupied by reacting particles)

tetrafluoroethene + tetrafluoroethene + tetrafluoroethene + tetrafluoroethene $+\ldots$
(ii)the double bond joining the tetrafluoroethene molecule break to free radicals

(iii)the free radicals collide with each other and join to form a larger molecule

Lone pair of electrons can be used to join more monomers to form longer polytetrafluoroethene.
polytetrafluoroethene molecule can be represented as:

Since the molecule is a repetition of one monomer, then the polymer is:

Examples

Polytetrafluorothene has a molar mass of 4760.Calculate the number of tetrafluoroethene molecules in the polymer( $\mathrm{C}=12.0, \mathrm{~F}=19$ )
Number of monomers/repeating units in monomer $=$ Molar mass polymer
Molar mass monomer
=> Molar mass ethene $\left(\mathrm{C}_{2} \mathrm{~F}_{4}\right)=62.5$ Molar mass polyethene $=4760$
Substituting $\frac{4760}{62.5}=\underline{77.16}=>\underline{77 \text { polychloroethene molecules(whole number) }}$
The commercial name of polytetrafluorethene(P.T.F.E) is Teflon(P.T.F.E). It is a tough, non-transparent and durable plastic. PVC is used:
(i)in making plastic rope
(ii)water pipes
(iii)crates and boxes
5.Formation of rubber from Latex

Natural rubber is obtained from rubber trees.
During harvesting an incision is made on the rubber tree to produce a milky white substance called latex.
Latex is a mixture of rubber and lots of water.
The latex is then added an acid to coagulate the rubber.
Natural rubber is a polymer of 2-methylbut-1,3-diene ;
$\mathrm{CH}_{2}=\mathrm{C}\left(\mathrm{CH}_{3}\right) \mathrm{CH}=\mathrm{CH}_{2} \quad \mathrm{H}-\mathrm{C}^{\mathrm{H}}=\mathrm{C}-\mathrm{C}^{\mathrm{CH}}=\mathrm{C}_{3}^{\mathrm{H}}-\mathrm{H}$
During natural polymerization to rubber, one double $\mathrm{C}=\mathrm{C}$ bond break to self add to another molecule.The double bond remaining move to carbon " 2 " thus;

Generally the structure of rubber is thus;

Pure rubber is soft and sticky.It is used to make erasers, car tyres. Most of it is vulcanized.Vulcanization is the process of heating rubber with sulphur to make it harder/tougher.
During vulcanization the sulphur atoms form a cross link between chains of rubber molecules/polymers. This decreases the number of $\mathrm{C}=\mathrm{C}$ double bonds in the polymer.

Vulcanized rubber is used to make tyres, shoes and valves.

## 6. Formation of synthetic rubber

Synthetic rubber is able to resist action of oil,abrasion and organic solvents which rubber cannot.
Common synthetic rubber is a polymer of 2-chlorobut-1,3-diene ;
$\mathrm{CH}_{2}=\mathrm{C}\left(\mathrm{Cl} \mathrm{CH}=\mathrm{CH}_{2}\right.$
$\mathrm{H}-\mathrm{C}=\mathrm{C}-\mathrm{C}=\mathrm{C}-\mathrm{H}$

During polymerization to synthetic rubber, one double $\mathrm{C}=\mathrm{C}$ bond is broken to self add to another molecule. The double bond remaining move to carbon " 2 " thus;

Generally the structure of rubber is thus;

Rubber is thus strengthened through vulcanization and manufacture of synthetic rubber.

## (b)Condensation polymerization

Condensation polymerization is the process where two or more small monomers join together to form a larger molecule by elimination/removal of a simple molecule. (usually water).
Condensation polymers acquire a different name from the monomers because the two monomers are two different compounds
During condensation polymerization:
(i)the two monomers are brought together by high pressure to reduce distance between them.
(ii)monomers realign themselves at the functional group.
(iii)from each functional group an element is removed so as to form simple molecule (of usually $\mathrm{H}_{2} \mathrm{O} / \mathrm{HCl}$ )
(iv)the two monomers join without the simple molecule of $\mathrm{H}_{2} \mathrm{O} / \mathrm{HCl}$

## Examples of condensation polymerization

## 1.Formation of Nylon-6,6

Method 1: Nylon-6,6 can be made from the condensation polymerization of hexan-1,6-dioic acid with hexan-1,6-diamine.Amines are a group of homologous series with a general formula $\mathrm{R}-\mathrm{NH}_{2}$ and thus $-\mathrm{NH}_{2}$ as the functional group.
During the formation of Nylon-6,6:
(i)the two monomers are brought together by high pressure to reduce distance between them and realign themselves at the functional groups.

(iii)from each functional group an element is removed so as to form a molecule of $\mathrm{H}_{2} \mathrm{O}$ and the two monomers join at the linkage .

Nylon-6,6 derive its name from the two monomers each with six carbon chain

Method 2: Nylon-6,6 can be made from the condensation polymerization of hexan-1,6-dioyl dichloride with hexan-1,6-diamine.
Hexan-1,6-dioyl dichloride belong to a group of homologous series with a general formula $\mathrm{R}-\mathrm{OCl}$ and thus -OCl as the functional group.
The $\mathrm{R}-\mathrm{OCl}$ is formed when the " OH " in $\mathrm{R}-\mathrm{OOH} /$ alkanoic acid is replaced by $\mathrm{Cl} /$ chlorine/Halogen

During the formation of Nylon-6,6:
(i)the two monomers are brought together by high pressure to reduce distance between them and realign themselves at the functional groups.

(iii)from each functional group an element is removed so as to form a molecule of HCl and the two monomers join at the linkage .

Polymer bond linkage
The two monomers each has six carbon chain hence the name "nylon-6,6"
The commercial name of Nylon-6,6 is Nylon It is a a tough, elastic and durable plastic. It is used to make clothes, plastic ropes and carpets.
$\underline{\text { 2.Formation of Terylene }}$

Method 1: Terylene can be made from the condensation polymerization of ethan-1,2-diol with benzene-1,4-dicarboxylic acid.
Benzene-1,4-dicarboxylic acid a group of homologous series with a general formula $\mathrm{R}-\mathrm{COOH}$ where R is a ring of six carbon atom called Benzene ring .The functional group is - COOH .
During the formation of Terylene:
(i)the two monomers are brought together by high pressure to reduce distance between them and realign themselves at the functional groups.

(iii)from each functional group an element is removed so as to form a molecule of $\mathrm{H}_{2} \mathrm{O}$ and the two monomers join at the linkage .

Polymer bond linkage of terylene

$$
\begin{aligned}
& \mathrm{H}-\mathrm{O}-\stackrel{\mathrm{O}}{\mathrm{C}}-\stackrel{\mathrm{O}}{\mathrm{O}}-\mathrm{C}-\mathrm{O}-\mathrm{H} \\
& \text { benzene-1,4-dicarboxylic acid } \\
& \text { Ethan-1,2-diol }
\end{aligned}
$$

$$
\begin{aligned}
& \text { Terylene(Polyester/polyster) }
\end{aligned}
$$

Method 2: Terylene can be made from the condensation polymerization of benzene-1,4-dioyl dichloride with ethan-1,2-diol.
Benzene-1,4-dioyl dichloride belong to a group of homologous series with a general formula $\mathrm{R}-\mathrm{OCl}$ and thus -OCl as the functional group and R as a benzene ring.
The $\mathrm{R}-\mathrm{OCl}$ is formed when the " OH " in $\mathrm{R}-\mathrm{OOH}$ is replaced by $\mathrm{Cl} /$ chlorine/Halogen
During the formation of Terylene
(i)the two monomers are brought together by high pressure to reduce distance between them and realign themselves at the functional groups.

(iii)from each functional group an element is removed so as to form a molecule of HCl and the two monomers join at the linkage .

$$
\begin{aligned}
& \stackrel{\stackrel{O}{\|}-\stackrel{O}{\|}-(-\mathrm{O}-\mathrm{Cl}}{\mathrm{Cl}-\mathrm{O}} \\
& \text { benzene-1,4-dioyl dichloride } \\
& \mathbf{H}-\mathbf{O}-\underset{\mathbf{H}}{\stackrel{\mathbf{H}}{\mathbf{H}}}-\stackrel{\mathbf{H}}{\mathbf{C}} \underset{\mathbf{H}}{\mathbf{C}}-\mathbf{O}-\mathbf{H} \\
& \text { Ethan-1,2-diol }
\end{aligned}
$$

$$
\begin{aligned}
& \text { Terylene(Polyester/polyster) } \\
& \text { Condensation polymerization of benzene-1,4-dioyl dichloride } \\
& \text { with Ethan-1,2-diol to form Terylene }
\end{aligned}
$$

The commercial name of terylene is Polyester /polyster It is a a tough, elastic and durable plastic. It is used to make clothes, plastic ropes and sails and plastic model kits.

## Practice questions Organic chemistry

1. A student mixed equal volumes of Ethanol and butanoic acid. He added a few drops of concentrated Sulphuric (VI) acid and warmed the mixture
(i) Name and write the formula of the main products

## Name

$\qquad$
Formula.
(ii) Which homologous series does the product named in (i) above belong?
2. The structure of the monomer phenyl ethene is given below:-

a) Give the structure of the polymer formed when four of the monomers are added together
b) Give the name of the polymer formed in (a) above
3. Explain the environmental effects of burning plastics in air as a disposal method
4. Write chemical equation to represent the effect of heat on ammonium carbonate
5. Sodium octadecanoate has a chemical formula $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{6} \mathrm{COO}^{-} \mathrm{Na}^{+}$, which is used as soap.

Explain why a lot of soap is needed when washing with hard water
6. A natural polymer is made up of the monomer:

(a) Write the structural formula of the repeat unit of the polymer
(b) When $5.0 \times 10^{-5}$ moles of the polymer were hydrolysed, 0.515 g of the monomer were obtained.

Determine the number of the monomer molecules in this polymer.

$$
(\mathrm{C}=12 ; \mathrm{H}=1 ; \mathrm{N}=14 ; \mathrm{O}=16)
$$

7. The formula below represents active ingredients of two cleansing agents $\mathbf{A}$ and B

Agent A
$\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{6} \mathrm{COO}^{-} \mathrm{Na}^{+}$

Agent B

Which one of the cleansing agents would be suitable to be used in water containing magnesium hydrogen carbonate? Explain
(b) Study the flow chart below and use it to answer the questions that follow.

8. Study the polymer below and use it to answer the questions that follow:

(a) Give the name of the monomer and draw its structures
(b) Identify the type of polymerization that takes place
(c) State one advantage of synthetic polymers
9. Ethanol and Pentane are miscible liquids. Explain how water can be used to separate a mixture of ethanol and pentane
10.

(a) What is absolute ethanol?
(b) State $\mathbf{t w o}$ conditions required for process $\mathbf{G}$ to take place efficiently
11. (a) (i) The table below shows the volume of oxygen obtained per unit time when hydrogen
peroxide was decomposed in the presence of manganese (IV) Oxide. Use it to answer the questions that follow:-

| Time in seconds | Volume of Oxygen <br> evolved $\left(\mathbf{c m}^{\mathbf{3}}\right)$ |
| :---: | :---: |
| 0 | 0 |
| 30 | 10 |
| 60 | 19 |
| 90 | 27 |
| 120 | 34 |
| 150 | 38 |
| 180 | 43 |
| 210 | 45 |
| 270 | 45 |
| 300 | 45 |

(i) Plot a graph of volume of oxygen gas against time
(ii) Determine the rate of reaction at time 156 seconds
(iii) From the graph, find the time taken for $18 \mathrm{~cm}^{3}$ of oxygen to be produced
(iv) Write a chemical equation to show how hydrogen peroxide decomposes in the presence of manganese (IV) Oxide
(b) The diagram below shows how a Le'clanche (Dry cell) appears:-

(i) What is the function of $\mathrm{MnO}_{2}$ in the cell above?
(ii) Write the equation of a reaction that occurs at the cathode
(iii) Calculate the mass of Zinc that is consumed when a current of 0.1 amperes flows
through the above cell for 30 minutes $(1 \mathrm{~F}=96500 \mathrm{c} \mathrm{Zn}=65$ )
12. (a) Give the IUPAC names of the following compounds:
(i) $\mathrm{CH}_{3} \mathrm{COOCH}_{2} \mathrm{CH}_{3}$
*
(ii)

(b) The structure below shows some reactions starting with ethanol. Study it and answer

[^0](i) Write the formula of the organic compounds $\mathbf{P}$ and $\mathbf{S}$ *
(ii) Name the type of reaction, the reagent(s) and condition for the reactions in the following steps :-
(I) Step I *
(II) Step II *
(III) Step III
(iii) Name reagent $\mathbf{R}$
(iv) Draw the structural formula of $\mathbf{T}$ and give its name *
(v) (I) Name compound

U
(II) If the relative molecular mass of $\mathbf{U}$ is 42000 , determine the value of
n ( $\mathbf{C}=12, \mathbf{H}=1)$
(c) State why $\mathrm{C}_{2} \mathrm{H}_{4}$ burns with a more smoky flame than $\mathrm{C}_{2} \mathrm{H}_{6}$ *
13. a) State two factors that affect the properties of a polymer
b) Name the compound with the formula below :

## $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{ONa}$

c) Study the scheme below and use it to answer the questions that follow:-

i) Name the following compounds:-
I. Product $\mathbf{T}$
II. K .........
ii) State one common physical property of substance $\mathbf{G}$
iii) State the type of reaction that occurred in step $\mathbf{J}$
iv) Give one use of substance $\mathbf{K}$
v) Write an equation for the combustion of compound $\mathbf{P}$
vi) Explain how compounds $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COOH}$ and $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}$ can be distinguished chemically
vii) If a polymer $\mathbf{K}$ has relative molecular mass of 12,600 , calculate the value of $\mathbf{n}(\mathrm{H}=1 \mathrm{C}=12)$
14. Study the scheme given below and answer the questions that follow:-

(a) (i) Name compound $\mathbf{P}$
(ii) Write an equation for the reaction between $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COOH}$ and $\mathrm{Na}_{2} \mathrm{CO}_{3}$
(b) State one use of polymer $\mathbf{Q}$
(c) Name one oxidising agent that can be used in step II
(d) A sample of polymer $\mathbf{Q}$ is found to have a molecular mass of 4200 . Determine the number of monomers in the polymer $(\mathrm{H}=1, \mathrm{C}=12)$
(e) Name the type of reaction in step I
(f) State one industrial application of step III
(g)State how burning can be used to distinguish between propane and propyne. Explain your
answer
(h) $1000 \mathrm{~cm}^{3}$ of ethene $\left(\mathrm{C}_{2} \mathrm{H}_{4}\right)$ burnt in oxygen to produce Carbon (II) Oxide and water vapour.

Calculate the minimum volume of air needed for the complete combustion of ethene
(Air contains $20 \%$ by volume of oxygen)
15. (a) Study the schematic diagram below and answer the questions that follow:-

(i) Identify the following:

Substance Q

Substance
R
Gas
P $\qquad$
(ii) Name:

Step 1.

Step 4
(iii) Draw the structural formula of the major product of step 5
(iv) State the condition and reagent in step $\mathbf{3}$
16. Study the flow chart below and answer the questions that follow

| Ethyl |
| :---: |
| Ethanoate |

Reagent $\mathrm{a} \quad \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH} \mathrm{KMnO4} / \mathrm{H}^{+}($aq $)$

(a) (i) Name the following organic compounds:
M. $\qquad$
L. L................................................................................
(ii) Name the process in step:

Step 2

## Step 4

(iii) Identify the reagent $\mathbf{P}$ and $\mathbf{Q}$
(iv) Write an equation for the reaction between $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}$ and sodium
17. a) Give the names of the following compounds:
i) $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}$
ii) $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{COOH}$
iii) $\mathrm{CH}_{3} \mathrm{C}-\mathrm{O}-\mathrm{CH}_{2} \mathrm{CH}_{3}$
18. Study the scheme given below and answer the questions that follow; Step I

i) Name the reagents used in:

## Step I:

Step II

Step III
ii) Write an equation to show products formed for the complete combustion of $\mathrm{CH}=\mathrm{CH}$
iii) Explain one disadvantage of continued use of items made form the compound formed
in step III
19. A hydrated salt has the following composition by mass. Iron $20.2 \%$, oxygen $23.0 \%$,
sulphur $11.5 \%$, water $45.3 \%$
i) Determine the formula of the hydrated salt $(\mathrm{Fe}=56, \mathrm{~S}=32, \mathrm{O}=16, \mathrm{H}=11)$
ii) 6.95 g of the hydrated salt in $\mathbf{c}(\mathbf{i})$ above were dissolved in distilled water and the total
volume made to $250 \mathrm{~cm}^{3}$ of solution. Calculate the concentration of the resulting salt solution
in moles per litre. (Given that the molecula mass of the salt is 278)
20. Write an equation to show products formed for the complete combustion of $\mathrm{CH}=\mathrm{CH}$
iii) Explain one disadvantage of continued use of items made form the compound formed
in step III
21. Give the IUPAC name for each of the following organic compounds; i) $\mathrm{CH}_{3}-\mid \mathrm{CH}-\mathrm{CH}_{2}-\mathrm{CH}_{3}$

```
            OH
ii)}\mp@subsup{\textrm{CH}}{3}{}-\textrm{CH}-\mp@subsup{\textrm{CH}}{2}{}-\mp@subsup{\textrm{CH}}{2}{}-\mp@subsup{\textrm{CH}}{3}{
    |
        C2H5
        iii)}\mp@subsup{\textrm{CH}}{3}{}\mp@subsup{\textrm{COOCH}}{2}{}\mp@subsup{\textrm{CH}}{2}{}\mp@subsup{\textrm{CH}}{3}{
```

22. The structure below represents a cleansing agent.

$$
\begin{aligned}
& \text { O } \\
& \mathrm{R}-\mathrm{S}-\mathrm{O}^{-} \mathrm{Na}^{+} \\
& \text {॥ } \\
& \mathrm{O}
\end{aligned}
$$

a) State the type of cleansing agent represented above
b) State one advantage and one disadvantage of using the above cleansing agent.
23. The structure below shows part of polymer .Use it to answer the questions that follow.

| $\mathrm{CH}_{3}$ | $\mathrm{CH}_{3}$ | $\mathrm{CH}_{3}$ |
| :---: | :---: | :---: |
| $\mid$ | $\mid$ | $\mid$ |

## $-\mathbf{C H}-\mathrm{CH}_{2}-\mathrm{CH}-\mathrm{CH}_{2}-\mathrm{CH}-\mathrm{CH}_{2}-$

a) Derive the structure of the monomer
b) Name the type of polymerization represented above
24. The flow chart below represents a series of reactions starting with ethanoic acid:-

(a) Identify substances $\mathbf{A}$ and $\mathbf{B}$
(b) Name the process I
25. a) Write an equation showing how ammonium nitrate may be prepared starting with
ammonia gas
(b) Calculate the maximum mass of ammonium nitrate that can be prepared using 5.3 kg of
ammonia $(\mathrm{H}=1, \mathrm{~N}=14, \mathrm{O}=16)$
26. (a) What is meant by the term, esterification?
(b) Draw the structural formulae of two compounds that may be reacted to form ethylpropanoate
27. (a) Draw the structure of pentanoic acid
(b) Draw the structure and give the name of the organic compound formed when ethanol
reacts with pentanoic acid in presence of concentrated sulphuric acid
28. The scheme below shows some reactions starting with ethanol. Study it and answer the questions
that follow:-

(i) Name and draw the structure of substance $\mathbf{Q}$
(ii) Give the names of the reactions that take place in steps 2 and 4
(iii) What reagent is necessary for reaction that takes place in step 3
29. Substances $\mathbf{A}$ and $\mathbf{B}$ are represented by the formulae $\mathbf{R O H}$ and $\mathbf{R C O O H}$ respectively.

They belong to two different homologous series of organic compounds. If both A and B
react with potassium metal:
(a) Name the common product produced by both
(b) State the observation made when each of the samples $\mathbf{A}$ and $\mathbf{B}$ are reacted with sodium hydrogen carbonate
(i) $\mathbf{A}$
(ii) $\mathbf{B}$
30. Below are structures of particles. Use it to answer questions that follow. In each case only

$\mathrm{N}=$ Neutron
$\mathrm{X}=$ Electron

(a) Identify the particle which is an anion
31. Plastics and rubber are extensively used to cover electrical wires.
(a) What term is used to describe plastic and rubbers used in this way?
(b) Explain why plastics and rubbers are used this way
32. The scheme below represents the manufacture of a cleaning agent $\mathbf{X}$

(a) Draw the structure of $\mathbf{X}$ and state the type of cleaning agent to which $\mathbf{X}$ belong
(b) State one disadvantage of using $\mathbf{X}$ as a cleaning agent
33. Y grams of a radioactive isotope take 120days to decay to 3.5 grams. The half-life period of the isotope is 20days
(a) Find the initial mass of the isotope
(b) Give one application of radioactivity in agriculture
34. The structure below represents a polymer. Study and answer the questions that follow:-

(i) Name the polymer
above $\qquad$
(ii) Determine the value of $\mathbf{n}$ if giant molecule had relative molecular mass of 4956
35. $\mathrm{RCOO}^{-} \mathrm{Na}^{+}$and $\mathrm{RCH}_{2} \mathrm{OSO}_{3}-\mathrm{Na}^{+}$are two types of cleansing agents;
i) Name the class of cleansing agents to which each belongs
ii) Which one of these agents in (i) above would be more suitable when washing with water
from the Indian ocean. Explain
iii) Both sulphur (IV) oxide and chlorine are used bleaching agents. Explain the difference
in their bleaching properties
36. The formula given below represents a portion of a polymer

(a) Give the name of the polymer
(b) Draw the structure of the monomer used to manufacture the polymer

### 15.0.0 NITROGEN AND IT'S <br> COMPOUNDS ( 30 LESSONS)

Introduction to oxides of nitrogen
Nirogen has a position in second period of group V in the modern periodic table. It has molecular formula $\mathrm{N}_{2}$. It has atomic number 7 and atomic weight 14.08 and its electronic configuration of 2,5.

Besides combining with hydrogen and forming $\mathrm{NH}_{3}$, nitrogen combines with oxygen in different ratios and forms five different oxides.

The oxides of nitrogen and the details of the oxygen states of nitrogen and the $\mathrm{N}: \mathrm{O}$ ratio can be presented in a tabular form as:

| Name | Formula Oxidation state of N Ratio of $\mathrm{N}: \mathrm{O}$ |  |  |
| :---: | :---: | :---: | :---: |
| 1) Nitrogen Oxide or |  |  |  |
|  | NO | +2 | 1:1 |
| nitrous oxide |  |  |  |
| 2) Nitrogen dioxide | $\mathrm{NO}_{2}$ | +4 | 1:2 |
| 3) Nitrous oxide |  |  |  |
| (also called laughing gas) | $\mathrm{N}_{2} \mathrm{O}$ | +1 | 2:1 |

All of these oxides of nitrogen are gases, excepting NO and $\mathrm{N}_{2} \mathrm{O}$ the other oxides are brownish gases. Except the oxides of NO and $\mathrm{N}_{2} \mathrm{O}$ all the other oxides are acidic. NO and $\mathrm{N}_{2} \mathrm{O}$ are neutral.

The other oxides are prepared in the laboratory using different methods characteristic to each oxide.

## Example of Oxides of Nitrogen (nitric Oxide - NO)

## Structure:

Laboratory Preparation: The oxide is prepared in the laboratory by treating the metallic copper with a moderately concentarted nitric acid (1:1) at room temperature.

The reaction is given as :
$2 \mathrm{Cu}+8 \mathrm{HNO}_{3}----->\mathrm{Cu}\left(\mathrm{NO}_{3}\right)_{2}+2 \mathrm{NO}+4 \mathrm{H}_{2} \mathrm{O}$

The gas is collected by downward displacement of water.The apparatus used is Wolfe's apparatus. The purification is done by absorbing the NO gas in frashly prepared ferrous sulphate solution. Ferrous sulphate absorbs all the NO gas and forms
$\mathrm{Fe}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5} \mathrm{NO}$ and the solution becomes brown. On heating this solution pure Nitric Oxide is obatined.

Physical Properties: NO is not a combustible gas. At high temperature around $1000^{\circ} \mathrm{C}$ it decomposes into $\mathrm{N}_{2}$ and $\mathrm{O}_{2}$.

$$
2 \mathrm{NO}=\mathrm{N}_{2}+\mathrm{O}_{2} \quad \text { at high temperature }
$$

From the equation above we can see that once the decomposition starts $50 \% \mathrm{O} 2$ gets evolved and this $\mathrm{O}_{2}$ supports combustion thus making the reaction more violent.

## Chemical properties:

1) NO acts as an oxidising agent, oxidising $\mathrm{SO}_{2}$ in presence of water to give $\mathrm{H}_{2} \mathrm{SO}_{4}$ :

$$
\mathrm{SO}_{2}+2 \mathrm{NO}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{H}_{2} \mathrm{SO}_{4}+\mathrm{N}_{2} \mathrm{O}
$$

2) NO acts as a reducing agent,
i) reducing an acidified solution of potassium permanganate (pink) to colorless manganous salt.

$$
3 \mathrm{KMnO}_{4}+6 \mathrm{H}_{2} \mathrm{SO}_{4}+5 \mathrm{NO}_{2} \rightarrow 3 \mathrm{KHSO}_{4}+3 \mathrm{MnSO}_{4}+2 \mathrm{H}_{2} \mathrm{O}+5 \mathrm{NO}_{3}
$$

ii) It can also reduce aqueous solution of $\mathrm{I}_{2}$ to HI

$$
3 \mathrm{I}_{2}+2 \mathrm{NO}+4 \mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{HNO}_{3}+6 \mathrm{HI}
$$

3) With halogens NO can form addition compounds as

$$
2 \mathrm{NO}+\mathrm{Cl}_{2} \rightarrow 2 \mathrm{NOCl} \quad(\mathrm{NOCl} \text { is nitrosyl chloride })
$$

It reacts in the same way with flourine and bromine.
4) With ferrous sulphate NO forms an addition compound as

$$
\mathrm{FeSO}_{4}+5 \mathrm{H}_{2} \mathrm{O}+\mathrm{NO}=\left[\mathrm{Fe}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5} \mathrm{NO}\right] \mathrm{SO}_{4}
$$

penta aqua nitrosyl iron (II) sulphate
This is the famous brown ring test used to identify the nitrate radical or the NO radical.
Uses: NO is used to prepare nitric acid.

## Nitrogen Dioxide - NO2

## Structure:

NO 2

Laboratory Preparation: In the laboratory $\mathrm{NO}_{2}$ is prepared by thermal decomposition of $\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}$. Thus

$$
2 \mathrm{~Pb}\left(\mathrm{NO}_{3}\right)_{2} \rightarrow 2 \mathrm{PbO}+4 \mathrm{NO}_{2}+\mathrm{O}_{2}
$$

Care is taken to ensure the use of dried $\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}$ as hydrated nitrate salts on heating react violently and explode.

Physical Properties: $\mathrm{NO}_{2}$ is a poisonous gas, main source being the exhaust of automobiles.

1) At room temperature it is a deep brown gas.
2) It does not support combustion.
$3)$ It is not combustible.

## Chemical Properties:

1) With cold water $\mathrm{NO}_{2}$ reacts to give a mixture of $\mathrm{HNO}_{2}$ and $\mathrm{HNO}_{3}$ acid.
$2 \mathrm{NO}_{2}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{HNO}_{2}+\mathrm{HNO}_{3}$
2) With hot water the reaction is

$$
3 \mathrm{NO}_{2}+\mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{HNO}_{3}+\mathrm{NO}
$$

3) Being acidic it reacts with bases as

$$
2 \mathrm{NO}_{2}+\mathrm{KOH} \rightarrow \mathrm{KNO}_{3}+\mathrm{H}_{2} \mathrm{O}+\mathrm{KNO}_{2}
$$

4) It is also a strong oxidising agent.
$\mathrm{H}_{2} \mathrm{~S}+\mathrm{NO}_{2} \rightarrow \mathrm{NO}+\mathrm{H}_{2} \mathrm{~S}+\mathrm{S}$
5) With excess oxygen and water $\mathrm{NO}_{2}$ gives
$\mathrm{HNO}_{3} .4 \mathrm{NO}_{2}+\mathrm{O}_{2}+2 \mathrm{H}_{2} \mathrm{O} \rightarrow 4 \mathrm{HNO}_{3}$
6) It reacts with concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}$ to give nitrosyl hydrogen
sulphate $2 \mathrm{NO}_{2}+\mathrm{H}_{2} \mathrm{SO}_{4} \rightarrow \mathrm{SO}_{2}(\mathrm{OH}) \mathrm{ONO}+\mathrm{HNO}_{3}$
Uses: $\mathrm{NO}_{2}$ is used as a fuel in rockets besides being used to prepare $\mathrm{HNO}_{3}$.

## Nitrous Oxide - N2O (laughing Gas)

## Structure:

Laboratory Preparation: $\mathrm{N}_{2} \mathrm{O}$ can be prepared in the laboratory by heating $\mathrm{NH}_{4} \mathrm{NO}_{3}$ below $200^{\circ} \mathrm{C}$ to avoid explosion. Sometimes as a safety measure instead of directly using $\mathrm{NH}_{4} \mathrm{NO}_{3}$, a mixture of $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}$ and $\mathrm{NaNO}_{3}$ are heated to give $\mathrm{NH}_{4} \mathrm{NO}_{3}$ which decomposes further to give $\mathrm{N}_{2} \mathrm{O}$.
$\mathrm{NH}_{4} \mathrm{NO}_{3} \rightarrow \mathrm{~N}_{2} \mathrm{O}+\mathrm{H}_{2} \mathrm{O} \quad$ (endothermic reaction)

## Physical Properties:

1) $\mathrm{N}_{2} \mathrm{O}$ has a faint sweet smell and produces a tickling sensation on the neck when inhaled and makes people laugh hysterically. Excess of inhalation leads to unconsiousness.
2) Unlike other oxides of nitrogen, $\mathrm{N}_{2} \mathrm{O}$ supports combustion though it does not burn itself.

## Chemical Properties:

1) At very high temperature $\mathrm{N}_{2} \mathrm{O}$ decomposes to $\mathrm{N}_{2}$ and $\mathrm{O}_{2}$

$$
2 \mathrm{~N}_{2} \mathrm{O} \rightarrow 2 \mathrm{~N}_{2}+\mathrm{O}_{2}
$$

If a glowing piece of $\mathrm{Mg}, \mathrm{Cu}$, or P is introduced in such an environment, these pieces burn brightly due to the $\mathrm{O}_{2}$ produced from decomposition of $\mathrm{N}_{2} \mathrm{O}$.
2) With Sodium and potassium $\mathrm{N}_{2} \mathrm{O}$ reacts to give the corresponding peroxides liberating $\mathrm{N}_{2}$ in the process.
$2 \mathrm{~N}_{2} \mathrm{O}+2 \mathrm{Na} \rightarrow \mathrm{Na}_{2} \mathrm{O}+2 \mathrm{~N}_{2}$.
$\mathrm{Na}_{2} \mathrm{O}$ is sodium peroxide

## Uses:

1) It is used as propellent gas.
2) Used in combination with oxygen in the ratio $\mathrm{N}_{2} \mathrm{O}: \mathrm{O}_{2}=1: 10$ as a mild anaesthetic.

### 16.0.0 SULPHUR AND ITS COMPOUNDS <br> (25 LESSONS)

## A.SULPHUR (S)

Sulphur is an element in Group VI Group 16)of the Periodic table . It has atomic number 16 and electronic configuration 16 and valency 2 /divalent and thus forms the ion $\mathrm{S}^{2-}$
A. Occurrence.

Sulphur mainly occurs :
(i) as free element in Texas and Louisiana in USA and Sicily in Italy. (ii)Hydrogen sulphide gas in active volcanic areas e.g.
Olkaria near Naivasha in Kenya
(iii)as copper pyrites $\left(\mathrm{CuFeS}_{2}\right)$,Galena ( $\mathrm{PbS}, \mathrm{Zinc}$ blende $(\mathrm{ZnS})$ )and
iron pyrites $\left(\mathrm{FeS}_{2}\right)$ in other parts of the world.

## B. Extraction of Sulphur from Fraschs process

Suphur occurs about 200 metres underground. The soil structure in these areas is usually weak and can easily cave in.

Digging of tunnels is thus discouraged in trying to extract the mineral. Sulphur is extracted by drilling three concentric /round pipes of diameter of ratios 2:8: 18 centimeters.

Superheated water at $170^{\circ} \mathrm{C}$ and 10 atmosphere pressure is forced through the outermost pipe.

The high pressures ensure the water remains as liquid at high temperatures instead of vapour of vapour /gas.

The superheated water melts the sulphur because the melting point of sulphur is lower at about at about $115^{\circ} \mathrm{C}$.

A compressed air at 15 atmospheres is forced /pumped through the innermost pipe.

The hot air forces the molten sulphur up the middle pipe where it is collected and solidifies in a large tank.

It is about $99 \%$ pure.

## Hot compressed air

## C. Allotropes of Sulphur.

1. Sulphur exist as two crystalline allotropic
forms: (i)Rhombic sulphur
(ii)Monoclinic sulphur

| Rhombic sulphur | Monoclinic sulphur |
| :--- | :--- |
| Bright yellow crystalline solid | Pale yellow crystalline solid |
| Has a melting point of $113^{\circ} \mathrm{C}$ | Has a melting point of $119^{\circ} \mathrm{C}$ |
| Has a density of $2.06 \mathrm{gcm}^{-3}$ | Has a density of $1.96 \mathrm{gcm}^{-3}$ |
| Stable below $96^{\circ} \mathrm{C}$ | Stable above $96^{\circ} \mathrm{C}$ |
| Has octahedral structure | Has a needle-like structure |

Rhombic sulphur and Monoclinic sulphur have a transition temperature of $96^{\circ} \mathrm{C}$. This is the temperature at which one allotrope changes to the other.

Sketch of Octahedral structure of Rhombic sulphur

Sketch of the needle-ike structure of monoclinic sulphur
2. Sulphur exists in non-crystalline forms as:
(i)Plastic sulphur-

Plastic sulphur is prepared from heating powdered sulphur to boil then pouring a thin continuous stream in a beaker with cold water. A long thin elastic yellow thread of plastic sulphur is formed .If left for long it turn to bright yellow crystalline rhombic sulphur.
(ii)Colloidal sulphur-

Colloidal sulphur is formed when sodium thiosulphate $\left(\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}\right)$ is added hydrochloric acid to form a yellow precipitate.

## D. Heating Sulphur.

A molecule of sulphur exists as puckered ring of eight atoms joined by covalent bonds as $\mathrm{S}_{8}$.

On heating the yellow sulphur powder melts at $113^{\circ} \mathrm{C}$ to clear amber liquid with low viscosity and thus flows easily.
On further heating to $160^{\circ} \mathrm{C}$ the molten liquid darkens to a brown very viscous liquid that does not flow easily.
This is because the $\mathrm{S}_{8}$ rings break into $\mathrm{S}_{8}$ chain that join together to form very long chains made of over 100000 atoms of Sulphur.
The long chains entangle each other reducing their mobility /flow and hence increases their viscosity.

On continued further heating to above $160^{\circ} \mathrm{C}$, the viscous liquid darkens but becomes more mobile/flows easily and thus less viscous.

This is because the long chains break to smaller/shorter chains.
At $444^{\circ} \mathrm{C}$, the liquid boils and forms brown vapour of a mixture of $\mathrm{S}_{8}, \mathrm{~S}_{6}, \mathrm{~S}_{2}$ molecules that solidifies to S 8 ring of "flowers of sulphur" on the cooler parts.

Summary of changes on heating sulphur

| Observation on heating | Explanation/structure of Sulphur |
| :--- | :--- |
| Solid sulphur | Puckered $\mathrm{S}_{8}$ ring |
| Heat to $113^{\circ} \mathrm{C}$ |  |
| Amber yellow liquid | Puckered $\mathrm{S}_{8}$ ring in liquid form (low <br> viscosity/flow easily) <br> Heat to $160^{\circ} \mathrm{C}$ <br> Liquid darkens |
| Puckered $\mathrm{S}_{8}$ ring break/opens then join <br> to form long chains that entangle (very <br> high viscosity/very low rate of flow) |  |
| Liquid boils to brown vapour to $444^{\circ} \mathrm{C}$ | Mixture of $\mathrm{S}_{8}, \mathrm{~S}_{6}, \mathrm{~S}_{2}$ vapour |
| Cool to room temperature |  |
| Yellow sublimate <br> (Flowers of Sulphur) | Puckered $\mathrm{S}_{8}$ ring |

## E. Physical and Chemical properties of Sulphur.(Questions)

1. State three physical properties unique to Sulphur Sulphur is a yellow solid, insoluble in water, soluble in carbon disulphide/tetrachloromethane/benzene, poor conductor of heat and electricity. It has a melting point of $115^{\circ} \mathrm{C}$ and a boiling point of $444^{\circ} \mathrm{C}$.
2. Moist/damp/wet blue and red litmus papers were put in a gas jar containing air/oxygen. Burning sulphur was then lowered into the gas jar. State and explain the observation made.

## Observations

-Sulphur melts then burns with a blue flame
Colourless gas produced that has a pungent smell
Red litmus paper remains red. Blue litmus paper turns red.

## Explanation

Sulphur burns in air and faster in Oxygen to form Sulphur(IV)Oxide gas and traces/small amount of Sulphur(VI)Oxide gas. Both oxides react with water to form the corresponding acidic solution i.e
(i) Sulphur(IV)Oxide gas reacts with water to form sulphuric(IV)acid
(ii) Sulphur(VI)Oxide gas reacts with water to form sulphuric(VI)acid Chemical equation

| $\mathrm{S}(\mathrm{s})$ | $+\mathrm{O}_{2}(\mathrm{~g})$ | $->$ | $\mathrm{SO}_{2}(\mathrm{~g})$ (Sulphur(IV)Oxide gas) |
| :--- | :--- | :--- | :--- |
| $2 \mathrm{~S}(\mathrm{~s})$ | $+3 \mathrm{O}_{2}(\mathrm{~g})$ | $->$ | $2 \mathrm{SO}_{3}(\mathrm{~g})$ (Sulphur(VI)Oxide gas traces) |
| $\mathrm{SO}_{2}(\mathrm{~g})$ | $+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ | $->$ | $\mathrm{H}_{2} \mathrm{SO}_{3}(\mathrm{aq})$ ( sulphuric(IV)acid) |
| $\mathrm{SO}_{3}(\mathrm{~g})$ | $+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ | $->$ | $\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})$ ( sulphuric(VI)acid). |

3. Iron filings were put in a test tube containing powdered sulphur then heated on a Bunsen flame. Stop heating when reaction starts. State and explain the observations made. Test the effects of a magnet on the mixture before and after heating. Explain.

## Observations

Before heating, the magnet attracts iron filings leaving sulphur After heating, the magnet does not attract the mixture.
After heating, a red glow is observed that continues even when heating is stopped..
Black solid is formed.

## Explanation

Iron is attracted to a magnet because it is ferromagnetic.
When a mixture of iron and sulphur is heated, the reaction is exothermic giving out heat energy that makes the mixture to continue glowing even after stopping heating.
Black Iron(II)sulphide is formed which is a compound and thus not ferromagnetic.

Chemical equation

$$
\overline{\mathrm{Fe}(\mathrm{~s})+\mathrm{S}(\mathrm{~s})} \quad->\mathrm{FeS}(\mathrm{~s})(\text { Exothermic reaction } /-\Delta \mathrm{H})
$$

Heated powdered heavy metals combine with sulphur to form black sulphides.

| $\mathrm{Cu}(\mathrm{s})$ | $+\mathrm{S}(\mathrm{s})$ | $->$ | $\mathrm{CuS}(\mathrm{s})$ |
| :--- | :--- | :--- | :--- |
| $\mathrm{Zn}(\mathrm{s})$ | $+\mathrm{S}(\mathrm{s})$ | $->$ | $\mathrm{ZnS}(\mathrm{s})$ |
| $\mathrm{Pb}(\mathrm{s})$ | $+\mathrm{S}(\mathrm{s})$ | $->$ | $\mathrm{PbS}(\mathrm{s})$ |

4.The set up below show the reaction of sulphur on heated concentrated sulphuric(VI)acid.

## (i)State and explain the observation made.

## Observation

Yellow colour of sulphur fades
Orange colour of potassium dichromate(VI)paper turns to green.

## Explanation

Hot concentrated sulphuric(VI)acid oxidizes sulphur to sulphur (IV)oxide gas. The oxide is also reduced to water. Traces of sulphur (VI)oxide is formed.

Chemical equation
$\mathrm{S}(\mathrm{s})+3 \mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{l}) \quad->3 \mathrm{SO}_{2}(\mathrm{~g})+3 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{SO}_{3}(\mathrm{~g})$
Sulphur (IV)oxide gas turns Orange potassium dichromate(VI)paper to green.
(ii)State and explain the observation made if concentrated sulphuric (VI) acid is replaced with concentrated Nitric (V) acid in the above set up.

Observation
Yellow colour of sulphur fades
Colurless solution formed
Brown fumes/gas produced.

## Explanation

Hot concentrated Nitric(V)acid oxidizes sulphur to sulphuric (VI)acid.
The Nitric (V) acid is reduced to brown nitrogen(IV)oxide gas.
Chemical equation
$\mathrm{S}(\mathrm{s})+6 \mathrm{HNO}_{3}(\mathrm{l}) \quad->6 \mathrm{NO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{l})$

NB:
Hydrochloric acid is a weaker oxidizing agent and thus cannot oxidize sulphur like the other mineral acids.

## 5.State three main uses of sulphur

Sulphur is mainly used in:
(i)Contact process for the manufacture/industrial/large scale production of concentrated sulphuric(VI)acid.
(ii)Vulcanization of rubber to make it harder, tougher, stronger, and more durable.
(iii)Making gun powder and match stick heads
(iv) As ointments to treat fungal infections

## 6. Revision Practice

The diagram below represents the extraction of sulphur by Fraschs process. Use it to answer the questions that follow.

(a)Name the substances that passes through:

M Superheated water at 170 oC and 10 atmosphere pressure
L Hot compressed air
N Molten sulphur
(b)What is the purpose of the substance that passes through $L$ and $M$ ?

M- Superheated water at $170^{\circ} \mathrm{C}$ and 10 atmosphere pressure is used to melt the sulphur

L- Hot compressed air is used to force up the molten sulphur.
(c) The properties of the two main allotropes of sulphur represented by letters $A$ and $B$ are given in the table below. Use it to answer the questions that follow.

|  | A | B |
| :--- | :--- | :--- |
| Appearance | Bright yellow | Pale yellow |
| Density $\left(\right.$ gcm $\left.^{-3}\right)$ | 1.93 | 2.08 |
| Melting point $\left({ }^{\mathbf{0}} \mathbf{C}\right)$ | 119 | 113 |
| Stability | Above $\mathbf{9 6}^{\mathbf{0}} \mathrm{C}$ | Below $\mathbf{9 6}^{\mathbf{0}} \mathrm{C}$ |

I.What are allotropes?

Different forms of the same element existing at the same temperature and pressure without change of state.

## II. Identify allotrope:

A. Monoclinic sulphur

B . Rhombic sulphur

## III. State two main uses of sulphur.

-Manufacture of sulphuric(VI)acid
-as fungicide
-in vulcanization of rubber to make it harder/tougher/
stronger -manufacture of dyes /fibres
(d)Calculate the volume of sulphur (IV)oxide produced when 0.4 g of sulphur is completely burnt in excess air. $(\mathrm{S}=32.0$,I mole of a gas occupies 24 dm 3 at room temperature)

Chemical equation
$\mathrm{S}(\mathrm{s})+\mathrm{O}_{2}(\mathrm{~g})->\mathrm{SO}_{2}(\mathrm{~g})$
Mole ratio $\mathrm{S}: \mathrm{SO}_{2}=1: 1$

## Method 1

$$
\begin{aligned}
& 32.0 \mathrm{~g} \text { of sulphur }->24 \mathrm{dm} 3 \text { of } \mathrm{SO}_{2}(\mathrm{~g}) \\
& 0.4 \mathrm{~g} \text { of sulphur }->\underline{0.4 \mathrm{~g} \mathrm{x} 24 \mathrm{dm} 3}=\underline{0.3 \mathrm{dm} 3}
\end{aligned}
$$

$$
32.0 \mathrm{~g}
$$

## Method 2

$\overline{\text { Moles of sulphur used }}=\underline{\text { Mass of sulphur }}$ Molar mass of sulphur $\quad \Rightarrow \underline{0.4}=\underline{0.0125 \mathrm{moles}}$
Moles of sulphur used $=$ Moles of sulphur(IV)oxide used=>0.0125 moles
Volume of sulphur(IV)oxide used $=$ Moles of sulphur(IV)oxide x volume of one mole of gas $=>0.0125$ moles $\times 24 \mathrm{dm} 3=\underline{\mathbf{0 . 3 ~ d m} 3}$

## B.COMPOUNDS OF SULPHUR

The following are the main compounds of sulphur:
(i) Sulphur(IV)oxide
(ii) Sulphur(VI)oxide
(iii) Sulphuric(VI)acid
(iv) Hydrogen Sulphide
(v) Sulphate(IV)/SO3 ${ }^{2-}$ and Sulphate(VI)/ $\mathrm{SO}_{4}{ }^{2-}$ salts
(i) Sulphur(IV)oxide( $\mathrm{SO}_{2}$ )

## (a) Occurrence

Sulphur (IV)oxide is found in volcanic areas as a gas or dissolved in water from geysersand hot springs in active volcanic areas of the world e.g. Olkaria and Hells gate near Naivasha in Kenya.

## (b) School laboratory preparation

In a Chemistry school laboratory Sulphur (IV)oxide is prepared from the reaction of

## Method 1:Using Copper and Sulphuric(VI)acid.

Method 2:Using Sodium Sulphate(IV) and hydrochloric acid.

## (c)Properties of Sulphur(IV)oxide(Questions)

1. Write the equations for the reaction for the formation of sulphur (IV)oxide using:
(i)Method 1
$\mathrm{Cu}(\mathrm{s})+2 \mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{l})->\mathrm{CuSO}_{4}(\mathrm{aq})+\mathrm{SO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
$\mathrm{Zn}(\mathrm{s})+2 \mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{l})->\mathrm{ZnSO}_{4}(\mathrm{aq})+\mathrm{SO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
$\mathrm{Mg}(\mathrm{s})+2 \mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{l})->\mathrm{MgSO}_{4}(\mathrm{aq})+\mathrm{SO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
$\mathrm{Fe}(\mathrm{s})+2 \mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{l})->\mathrm{FeSO}_{4}(\mathrm{aq})+\mathrm{SO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
Calcium ,Lead and Barium will form insoluble sulphate(VI)salts that will cover unreacted metals stopping further reaction thus producing very small amount/quantity of sulphur (IV)oxide gas.
(ii)Method 2

$$
\begin{aligned}
& \mathrm{Na}_{2} \mathrm{SO}_{3}(\mathrm{aq})+\mathrm{HCl}(\mathrm{aq})->\mathrm{NaCl}(\mathrm{aq})+\mathrm{SO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
& \mathrm{K}_{2} \mathrm{SO}_{3}(\mathrm{aq})+\mathrm{HCl}(\mathrm{aq})->\mathrm{KCl}(\mathrm{aq})+\mathrm{SO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
& \mathrm{BaSO}_{3}(\mathrm{~s})+2 \mathrm{HCl}(\mathrm{aq})->\mathrm{BaCl}_{2}(\mathrm{aq})+\mathrm{SO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
& \mathrm{CaSO}_{3}(\mathrm{~s})+2 \mathrm{HCl}(\mathrm{aq})->\mathrm{CaCl}_{2}(\mathrm{aq})+\mathrm{SO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
& \mathrm{PbSO}_{3}(\mathrm{~s})+2 \mathrm{HCl}(\mathrm{aq})->\mathrm{PbCl}_{2}(\mathrm{~s})+\mathrm{SO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
\end{aligned}
$$

Lead(II)chloride is soluble on heating thus reactants should be heated to prevent it coating/covering unreacted $\mathrm{PbSO}_{3}(\mathrm{~s})$

## 2.State the physical properties unique to sulphur (IV)oxide gas.

Sulphur (IV)oxide gas is a colourless gas with a pungent irritating and choking smell which liquidifies easily. It is about two times denser than air.
3. The diagram below show the solubility of sulphur (IV)oxide gas. Explain.

Sulphur(IV) oxide is very soluble in water.
One drop of water dissolves all the Sulphur (IV) oxide in the flask leaving a vacuum.
If the clip is removed, atmospheric pressure forces the water up through the narrow tube to form a fountain to occupy the vacuum.
An acidic solution of sulphuric (IV)acid is formed which turns litmus solution red.
Chemical equation $\mathrm{SO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
$->\mathrm{H}_{2} \mathrm{SO}_{3}(\mathrm{aq})$ ( sulphuric(IV)acid turn litmus red)
4.Dry litmus papers and wet/damp/moist litmus papers were put in a gas jar containing sulphur(IV) oxide gas. State and explain the observations made.

## Observations

(i)Dry Blue litmus paper remains blue.

Dry red litmus paper remains red.
(ii) Wet/damp/moist blue litmus paper turns red.

Moist/damp/wet red litmus paper remains red. Both
litmus papers are then bleached /decolorized.

## Explanation

Dry sulphur(IV) oxide gas is a molecular compound that does not dissociate/ionize to release $\mathrm{H}+(\mathrm{aq})$ ions and thus has no effect on dry blue/red litmus papers.
Wet/damp/moist litmus papers contain water that dissolves /react with dry sulphur(IV) oxide gas to form a solution of weak sulphuric(IV)acid ( $\mathrm{H}_{2}$ $\mathrm{SO}_{3}(\mathrm{aq})$ ).
Weak sulphuric(IV)acid( $\left.\mathrm{H}_{2} \mathrm{SO}_{3}(\mathrm{aq})\right)$ dissociates /ionizes into free $\mathrm{H}+(\mathrm{aq})$ ions:

$$
\mathrm{H}_{2} \mathrm{SO}_{3}(\mathrm{aq})->2 \mathrm{H}^{+}(\mathrm{aq})+\mathrm{SO}_{3}^{2-}(\mathrm{aq})
$$

The free $\mathrm{H}^{+}(\mathrm{aq})$ ions are responsible for turning blue litmus paper turns red showing the gas is acidic.
The $\mathrm{SO}_{3}{ }^{2-}$ (aq) ions in wet/damp/moist sulphur(IV) oxide gas is responsible for many reactions of the gas.
It is easily/readily oxidized to sulphate(VI) $\mathrm{SO}_{4}{ }^{2-}$ (aq) ions making sulphur(IV)

## (a)Bleaching agent

Wet/damp/moist coloured flowers/litmus papers are bleached/decolorized when put in sulphur(IV) oxide gas.
This is because sulphur(IV) oxide removes atomic oxygen from the coloured dye/ material to form sulphuric(VI)acid.
Chemical equations
(i)Formation of sulphuric(IV)acid

$$
\mathrm{SO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \quad->\quad \mathrm{H}_{2} \mathrm{SO}_{3}(\mathrm{aq})
$$

(ii)Decolorization/bleaching of the dye/removal of atomic oxygen.

Method I. $\mathrm{H}_{2} \mathrm{SO}_{3}(\mathrm{aq})+($ dye +O$)$-> $\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})+$ dye
(coloured) (colourless)
Method II. $\mathrm{H}_{2} \mathrm{SO}_{3}(\mathrm{aq})+\underset{\text { (coloured) }}{(\text { dye })}->\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})$
$+($ dye -O$)$
(colourless)

Sulphur(IV) oxide gas therefore bleaches by reduction /removing oxygen from a dye unlike chlorine that bleaches by oxidation /adding oxygen.
The bleaching by removing oxygen from Sulphur(IV) oxide gas is temporary.

This is because the bleached dye regains the atomic oxygen from the atmosphere/air in presence of sunlight as catalyst thus regaining/restoring its original colour. e.g.

Old newspapers turn brown on exposure to air on regaining the atomic oxygen. The bleaching through adding oxygen by chlorine gas is permanent.

## (b)Turns Orange acidified potassium dichromate(VI) to green

## Experiment:

(i)Pass a stream of Sulphur(IV) oxide gas in a test tube containing acidified potassium dichromate(VI) solution. or;
(ii)Dip a filter paper soaked in acidified potassium dichromate(VI) into a gas jar containing Sulphur(IV) oxide gas.

## Observation:

Orange acidified potassium dichromate(VI) turns to green.

## Explanation:

Sulphur(IV) oxide gas reduces acidified potassium dichromate(VI) from orange $\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}$ ions to green $\mathrm{Cr}^{3+}$ ions without leaving a residue itself oxidized from $\mathrm{SO}_{3}{ }^{2-}$ ions in sulphuric(IV) acid to $\mathrm{SO}_{4}{ }^{2-}$ ions in sulphuric(VI) acid.

Chemical/ionic equation:
(i)Reaction of Sulphur(IV) oxide gas with water

$$
\mathrm{SO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \quad->\quad \mathrm{H}_{2} \mathrm{SO}_{3}(\mathrm{aq})
$$

(ii)Dissociation /ionization of Sulphuric(IV)acid.

$$
\mathrm{H}_{2} \mathrm{SO}_{3}(\mathrm{aq})->2 \mathrm{H}+(\mathrm{aq})+\mathrm{SO}_{3}{ }^{2-}(\mathrm{aq})
$$

(iii)Oxidation of $\mathrm{SO}_{3}{ }^{2-}$ (aq)and reduction of $\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}(\mathrm{aq})$
$3 \mathrm{SO}_{3}{ }^{2-}(\mathrm{aq})+\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}(\mathrm{aq})+8 \mathrm{H}+(\mathrm{aq})->3 \mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})+2 \mathrm{Cr}^{3+}(\mathrm{aq})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
This is a confirmatory test for the presence of Sulphur(IV) oxide gas.
Hydrogen sulphide also reduces acidified potassium dichromate(VI) from orange $\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}$ ions to green $\mathrm{Cr}^{3+}$ ions leaving a yellow residue.

## Experiment:

(i)Pass a stream of Sulphur(IV) oxide gas in a test tube containing acidified potassium manganate(VII) solution. or;
(ii)Dip a filter paper soaked in acidified potassium manganate(VII) into a gas jar containing Sulphur(IV) oxide gas.

## Observation:

Purple acidified potassium manganate(VII) turns to colourless/ acidified potassium manganate(VII) is decolorized.

Explanation:
Sulphur(IV) oxide gas reduces acidified potassium manganate(VII) from purple $\mathrm{MnO}_{4}^{-}$ions to green $\mathrm{Mn}^{2+}$ ions without leaving a residue itself oxidized from $\mathrm{SO}_{3}{ }^{2-}$ ions in sulphuric(IV) acid to $\mathrm{SO}_{4}{ }^{2-}$ ions in sulphuric(VI) acid.
Chemical/ionic equation:
(i)Reaction of Sulphur(IV) oxide gas with water

$$
\mathrm{SO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \quad->\mathrm{H}_{2} \mathrm{SO}_{3}(\mathrm{aq})
$$

(ii)Dissociation /ionization of Sulphuric(IV)acid.

$$
\mathrm{H}_{2} \mathrm{SO}_{3}(\mathrm{aq})->2 \mathrm{H}+(\mathrm{aq})+\mathrm{SO}_{3}{ }^{2-}(\mathrm{aq})
$$

(iii)Oxidation of $\mathrm{SO}_{3}{ }^{2-}$ (aq)and reduction of $\mathrm{MnO}_{4}{ }^{-}$(aq)
$5 \mathrm{SO}_{3}{ }^{2-}(\mathrm{aq})+2 \mathrm{MnO}_{4}{ }^{-}(\mathrm{aq})+6 \mathrm{H}+(\mathrm{aq}) \quad->5 \mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})+2 \mathrm{Mn}^{2+}(\mathrm{aq})+3 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ (purple) (colourless)

This is another test for the presence of Sulphur(IV) oxide gas.
Hydrogen sulphide also decolorizes acidified potassium manganate(VII) from purple $\mathrm{MnO}_{4}{ }^{-}$ions to colourless $\mathrm{Mn}^{2+}$ ions leaving a yellow residue.

## (d)Decolorizes bromine water

## Experiment:

(i)Pass a stream of Sulphur(IV) oxide gas in a test tube containing bromine water . or;
(ii)Put three drops of bromine water into a gas jar containing Sulphur(IV) oxide gas. Swirl.

Observation:
Yellow bromine water turns to colourless/ bromine water is decolorized.

## Explanation:

Sulphur(IV) oxide gas reduces yellow bromine water to colourless hydrobromic acid $(\mathrm{HBr})$ without leaving a residue itself oxidized from $\mathrm{SO}_{3}{ }^{2-}$ ions in sulphuric (IV) acid to $\mathrm{SO}_{4}{ }^{2-}$ ions in sulphuric(VI) acid.

Chemical/ionic equation:
(i)Reaction of Sulphur(IV) oxide gas with water $\mathrm{SO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \quad->\mathrm{H}_{2} \mathrm{SO}_{3}(\mathrm{aq})$
(ii)Dissociation /ionization of Sulphuric(IV)acid.

$$
\mathrm{H}_{2} \mathrm{SO}_{3}(\mathrm{aq})->2 \mathrm{H}+(\mathrm{aq})+\mathrm{SO}_{3}^{2-}(\mathrm{aq})
$$

(iii)Oxidation of $\mathrm{SO}_{3}{ }^{2-}(\mathrm{aq})$ and reduction of $\mathrm{MnO}_{4}{ }^{-}$(aq)
$\left.\mathrm{SO}_{3}{ }^{2-}(\mathrm{aq})+\mathrm{Br}_{2}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \quad->\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})+\underset{(\mathrm{collourl}(\mathrm{aq}}{ }\right)$ (yellow)
(colourless)
This can also be used as another test for the presence of Sulphur(IV) oxide gas.
Hydrogen sulphide also decolorizes yellow bromine water to colourless leaving a yellow residue.
(i)Pass a stream of Sulphur(IV) oxide gas in a test tube containing about 3 cm 3 of Iron (III)chloride solution. or;
(ii)Place about 3 cm 3 of Iron (III)chloride solution into a gas jar containing Sulphur(IV) oxide gas.Swirl.

## Observation:

Yellow/brown Iron (III)chloride solution turns to green

## Explanation:

Sulphur(IV) oxide gas reduces Iron (III)chloride solution from yellow/brown $\mathrm{Fe}^{3+}$ ions to green $\mathrm{Fe}^{2+}$ ions without leaving a residue itself oxidized from $\mathrm{SO}_{3}{ }^{2-\mathrm{i}}$ ions in sulphuric(IV) acid to $\mathrm{SO}_{4}{ }^{2-}$ ions in sulphuric(VI) acid.

Chemical/ionic equation:
(i)Reaction of Sulphur(IV) oxide gas with water
$\mathrm{SO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \quad->\mathrm{H}_{2} \mathrm{SO}_{3}(\mathrm{aq})$
(ii)Dissociation /ionization of Sulphuric(IV)acid.
$\mathrm{H}_{2} \mathrm{SO}_{3}(\mathrm{aq})->2 \mathrm{H}+(\mathrm{aq})+\mathrm{SO}_{3}{ }^{2-}(\mathrm{aq})$
(iii)Oxidation of $\mathrm{SO}_{3}{ }^{2-}(\mathrm{aq})$ and reduction of $\mathrm{Fe}^{3+}$ (aq)
$\mathrm{SO}_{3}{ }^{2-}(\mathrm{aq})+2 \mathrm{Fe}^{3+}(\mathrm{aq})+3 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})->\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})+2 \mathrm{Fe}^{2+}(\mathrm{aq})+2 \mathrm{H}^{+}(\mathrm{aq})$
(yellow) (green)

## (f)Reduces Nitric(V)acid to Nitrogen(IV)oxide gas

## Experiment:

(i)Pass a stream of Sulphur(IV) oxide gas in a test tube containing about 3 cm 3 of concentrated nitric(V)acid. or;
(ii)Place about 3 cm 3 of concentrated nitric(V)acid into a gas jar containing Sulphur(IV) oxide gas. Swirl.

## Observation:

Brown fumes of a gas evolved/produced.

## Explanation:

Sulphur(IV) oxide gas reduces concentrated nitric(V)acid to brown nitrogen(IV)oxide gas itself oxidized from $\mathrm{SO}_{3}{ }^{2-}$ ions in sulphuric(IV) acid to $\mathrm{SO}_{4}{ }^{2-}$ ions in sulphuric(VI) acid.
Chemical/ionic equation:

$$
\begin{aligned}
& \mathrm{SO}_{2}(\mathrm{~g})+2 \mathrm{HNO}_{3}(\mathrm{l}) \quad->\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{l})+\mathrm{NO}_{2}(\mathrm{~g}) \\
& \text { (brown fumes/gas) }
\end{aligned}
$$

## (g)Reduces Hydrogen peroxide to water <br> Experiment:

(i)Pass a stream of Sulphur(IV) oxide gas in a test tube containing about 3 cm 3 of 20 volume hydrogen peroxide. Add four drops of Barium nitrate(V)or Barium chloride followed by five drops of 2M hydrochloric acid/ 2M nitric(V) acid.

## Observation:

A white precipitate is formed that persist/remains on adding 2M hydrochloric acid/ 2 M nitric( V ) acid.

## Explanation:

Sulphur(IV) oxide gas reduces 20 volume hydrogen peroxide and itself ${ }^{2-}$ ions oxidized from in sulphuric(IV) acid to $\mathrm{SO}_{4}{ }^{2-}$ ions in sulphuric(VI) $\mathrm{SO}_{3}$ acid.
When $\mathrm{Ba}^{2+}$ ions in Barium Nitrate(V) or Barium chloride solution is added, a white precipitate of insoluble Barium salts is formed showing the presence of of either $\mathrm{SO}_{3}{ }^{2-}, \mathrm{SO}_{4}{ }^{2-}, \mathrm{CO}_{3}{ }^{2-}$ ions. i.e.

Chemical/ionic equation:

$$
\left.\begin{array}{c}
\mathrm{SO}_{3}^{2-}(\mathrm{aq})+\mathrm{Ba}^{2+}(\mathrm{aq})->\mathrm{BaSO}_{3}(\mathrm{~s}) \\
\text { white precipitate }
\end{array}\right)
$$

If nitric(V)/hydrochloric acid is added to the three suspected insoluble white precipitates above, the white precipitate:
(i) persist/remains if $\mathrm{SO}_{4}{ }^{2-}$ (aq)ions ( $\mathrm{BaSO}_{4}(\mathrm{~s})$ ) is present.
(ii)dissolves if $\mathrm{SO}_{3}{ }^{2-}(\mathrm{aq})$ ions $\left(\mathrm{BaSO}_{3}(\mathrm{~s})\right.$ ) and $\mathrm{CO}_{3}{ }^{2-}(\mathrm{aq})$ ions
$\left(\mathrm{BaCO}_{3}(\mathrm{~s})\right.$ )is present. This is because:
I. $\mathrm{BaSO}_{3}(\mathrm{~s})$ reacts with Nitric(V)/hydrochloric acid to produce acidic $\mathrm{SO}_{2}$ gas that turns Orange moist filter paper dipped in acidified Potassium dichromate to green.

Chemical equation

$$
\mathrm{BaSO}_{3}(\mathrm{~s})+2 \mathrm{H}^{+}(\mathrm{aq})->\mathrm{Ba}^{2+}(\mathrm{aq})+\mathrm{SO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

I. $\mathrm{BaCO}_{3}(\mathrm{~s})$ reacts with Nitric(V)/hydrochloric acid to produce acidic $\mathrm{CO}_{2}$ gas that forms a white precipitate when bubbled in lime water. Chemical equation

$$
\mathrm{BaCO}_{3}(\mathrm{~s})+2 \mathrm{H}^{+}(\mathrm{aq})->\mathrm{Ba}^{2+}(\mathrm{aq})+\mathrm{CO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

## 5.Sulphur(IV)oxide also act as an oxidizing agent as in the following examples.

## (a)Reduction by burning Magnesium

## Experiment

Lower a burning Magnesium ribbon into agas jar containing
Sulphur(IV)oxide gas

## Observation

Magnesium ribbon continues to burn with difficulty.
White ash and yellow powder/speck

## Explanation

Sulphur(IV)oxide does not support burning/combustion. Magnesium burns to produce enough heat energy to decompose Sulphur(IV)oxide to sulphur and oxygen.
The metal continues to burn on Oxygen forming white Magnesium oxide solid/ash.
Yellow specks of sulphur residue form on the sides of reaction flask/gas jar. During the reaction, Sulphur(IV)oxide is reduced(oxidizing agent)while the metal is oxidized (reducing agent)

Chemical equation
$\mathrm{SO}_{2}(\mathrm{~g})+2 \mathrm{Mg}(\mathrm{s}) \quad->\quad 2 \mathrm{MgO}(\mathrm{s}) \quad+\mathrm{S}(\mathrm{s})$ (white ash/solid) (yellow speck/powder)

## (b)Reduction by Hydrogen sulphide gas

## Experiment

Put two drops of water into a gas jar containing dry Sulphur(IV)oxide gas Bubble hydrogen sulphide gas into the gas jar containing Sulphur(IV)oxide gas. Or
Put two drops of water into a gas jar containing dry Sulphur(IV)oxide gas Invert a gas jar full of hydrogen sulphide gas over the gas jar containing
Sulphur(IV)oxide gas. Swirl

## Observation

Yellow powder/speck

## Explanation

Sulphur(IV)oxide oxidizes hydrogen sulphide to yellow specks of sulphur residue and itself reduced to also sulphur that form on the sides of reaction flask/gas jar.
A little moisture/water act as catalyst/speeds up the reaction.
Chemical equation
$\mathrm{SO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{~S}(\mathrm{~g}) \quad->\quad 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \quad+3 \mathrm{~S}(\mathrm{~s})$
(yellow speck/powder)

## 6.Sulphur(IV)oxide has many industrial uses. State three.

(i)In the contact process for the manufacture of

Sulphuric(VI)acid (ii)As a bleaching agent of pulp and paper.
(iii)As a fungicide to kill microbes'
(iv)As a preservative of jam, juices to prevent fermentation

## (ii) Sulphur(VI)oxide( $\mathrm{SO}_{3}$ )

## (a) Occurrence

Sulphur (VI)oxide is does not occur free in nature/atmosphere

## (b) Preparation

In a Chemistry school laboratory Sulphur (VI)oxide may prepared from:
Method 1 ;Catalytic oxidation of sulphur(IV)oxide gas.
Sulphur(IV)oxide gas and oxygen mixture are first dried by being passed through Concentrated Sulphuric(VI)acid .
The dry mixture is then passed through platinised asbestos to catalyse/speed up the combination to form Sulphur (VI)oxide gas.
Sulphur (VI)oxide gas readily solidify as silky white needles if passed through a freezing mixture /ice cold water.

The solid fumes out on heating to a highly acidic poisonous gas.

## Chemical equation

$$
2 \mathrm{SO}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \quad-\text {-platinised asbestos--> } \quad 2 \mathrm{SO}_{3}(\mathrm{~g})
$$

## Method 2; Heating Iron(II)sulphate(VI) heptahydrate

When green hydrated Iron(II)sulphate(VI) heptahydrate crystals are heated in a boiling tube ,it loses the water of crystallization and colour changes from green to white.

## Chemical equation

$$
\mathrm{FeSO}_{4} .7 \mathrm{H}_{2} \mathrm{O}(\mathrm{~s})->\mathrm{FeSO}_{4}(\mathrm{~s})+7 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

$$
\text { (green solid) } \quad \text { (white solid) }
$$

On further heating ,the white anhydrous Iron(II)sulphate(VI) solid decomposes to a mixture of Sulphur (VI)oxide and Sulphur (IV)oxide gas.
Sulphur (VI) oxide readily / easily solidify as white silky needles when the mixture is passed through a freezing mixture/ice cold water. Iron(III)oxide is left as a brown residue/solid.

Chemical equation

$$
\begin{array}{ll}
2 \mathrm{FeSO}_{4}(\mathrm{~s}) \\
\text { (green solid) }
\end{array} \quad \underset{\text { (brown solid) }}{\mathrm{Fe}_{2} \mathrm{O}_{3}(\mathrm{~s})}+\mathrm{SO}_{2}(\mathrm{~g})+\mathrm{SO}_{3}(\mathrm{~g})
$$

## Caution

On exposure to air Sulphur (VI)oxide gas produces highly corrosive poisonous fumes of concentrated sulphuric(VI)acid and thus its preparation in a school laboratory is very risky.

## (c) Uses of sulphur(VI)oxide

One of the main uses of sulphur(VI)oxide gas is as an intermediate product in the contact process for industrial/manufacture/large scale/production of sulphuric(VI)acid.

## (iii) Sulphuric(VI)acid( $\mathrm{H}_{2} \mathrm{SO}_{4}$ )

## (a) Occurrence

Sulphuric (VI)acid $\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right)$ is one of the three mineral acids. There are three mineral acids;

Nitric(V)acid
Sulphuric(VI)acid
Hydrochloric acid.

Mineral acids do not occur naturally but are prepared in a school laboratory and manufactured at industrial level.

## (b)The Contact process for industrial manufacture of $\mathrm{H}_{2} \mathrm{SO}_{4}$.

## I. Raw materials

The main raw materials for industrial preparation of Sulphuric(VI)acid include:
(i)Sulphur from Fraschs process or from heating metal sulphide ore like Galena(PbS),Zinc blende(ZnS)
(ii)Oxygen from fractional distillation of air
(iii)Water from rivers/lakes

## II. Chemical processes

The contact process involves four main chemical processes:

## (i)Production of Sulphur (IV)oxide

As one of the raw materials, Sulphur (IV)oxide gas is got from the following sources;

## I. Burning/roasting sulphur in air.

Sulphur from Fraschs process is roasted/burnt in air to form Sulphur (IV)oxide gas in the burners

Chemical equation

$$
\mathrm{S}(\mathrm{~s})+\mathrm{O}_{2}(\mathrm{~g}) \quad-->\quad \mathrm{SO}_{2}(\mathrm{~g})
$$

## II. Burning/roasting sulphide ores in air.

Sulphur (IV)oxide gas is produced as a by product in extraction of some metals like:

- Lead from Lead(II)sulphide/Galena,(PbS)
- Zinc from zinc(II)sulphide/Zinc blende, (ZnS)
- Copper from Copper iron sulphide/Copper pyrites, ( $\mathrm{CuFeS}_{2}$ )

On roasting/burning, large amount/quantity of sulphur(IV)oxide is generated/produced.
Chemical equation
(i) $2 \mathrm{PbS}(\mathrm{s}) \quad+3 \mathrm{O}_{2}(\mathrm{~g}) \quad->2 \mathrm{PbO}(\mathrm{s}) \quad+2 \mathrm{SO}_{2}(\mathrm{~g})$
(ii) $2 \mathrm{ZnS}(\mathrm{s}) \quad+3 \mathrm{O}_{2}(\mathrm{~g}) \quad->2 \mathrm{ZnO}(\mathrm{s}) \quad+2 \mathrm{SO}_{2}(\mathrm{~g})$
(ii) $2 \mathrm{CuFeS}_{2}(\mathrm{~s}) \quad+4 \mathrm{O}_{2}(\mathrm{~g}) \quad->2 \mathrm{FeO}(\mathrm{s}) \quad+3 \mathrm{SO}_{2}(\mathrm{~g})+\mathrm{Cu}_{2} \mathrm{O}(\mathrm{s})$

Sulphur(IV)oxide easily/readily liquefies and thus can be transported to a far distance safely.

## (ii)Purification of Sulphur(IV)oxide

Sulphur(IV)oxide gas contain dust particles and Arsenic(IV)oxide as impurities. These impurities "poison"/impair the catalyst by adhering on/covering its surface.
The impurities are removed by electrostatic precipitation method .
In the contact process Platinum or Vanadium(V)oxide may be used.
Vanadium(V)oxide is preferred because it is :
(i) cheaper/less expensive
(ii) less easily poisoned by impurities

## (iii)Catalytic conversion of Sulphur(IV)oxide to Sulphur(VI)oxide

Pure and dry mixture of Sulphur (IV)oxide gas and Oxygen is heated to $450^{\circ} \mathrm{C}$ in a heat exchanger.
The heated mixture is passed through long pipes coated with pellets of Vanadium (V)oxide catalyst.
The close "contact" between the reacting gases and catalyst give the process its name.
Vanadium (V)oxide catalyse the conversion/oxidation of Sulphur(IV)oxide to Sulphur(VI)oxide gas.
Chemical equation

$$
2 \mathrm{SO}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \quad--\mathrm{V}_{2} \mathrm{O}_{5}-->\quad 2 \mathrm{SO}_{2}(\mathrm{~g})
$$

This reaction is exothermic $(-\Delta \mathbf{H})$ and the temperatures need to be maintained at around $450^{\circ} \mathrm{C}$ to ensure that:
(i)reaction rate/time taken for the formation of Sulphur(VI)oxide is not too slow/long at lower temperatures below $450^{\circ} \mathrm{C}$
(ii) Sulphur(VI)oxide gas does not decompose back to

Sulphur(IV)oxide gas and Oxygen gas at higher temperatures than $450^{\circ} \mathrm{C}$.

## (iv)Conversion of Sulphur(VI)oxide of Sulphuric(VI)acid

Sulphur(VI)oxide is the acid anhydride of concentrated Sulphuric(VI)acid. Sulphur(VI)oxide reacts with water to form thick mist of fine droplets of very/highly corrosive concentrated $\operatorname{Sulphuric}(\mathrm{VI})$ acid because the reaction is highly exothermic.
To prevent this, Sulphur (VI)oxide is a passed up to meet downward flow of $98 \%$ Sulphuric(VI)acid in the absorption chamber/tower.
The reaction forms a very viscous oily liquid called Oleum/fuming Sulphuric (VI) acid/ pyrosulphuric (VI) acid.

Chemical equation

$$
\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})+\mathrm{SO}_{3}(\mathrm{~g}) \quad \text {-> } \quad \mathrm{H}_{2} \mathrm{~S}_{2} \mathrm{O}_{7}(\mathrm{l})
$$

Oleum/fuming Sulphuric (VI) acid/ pyrosulphuric (VI) acid is diluted carefully with distilled water to give concentrated sulphuric (VI) acid .
Chemical equation

$$
\mathrm{H}_{2} \mathrm{~S}_{2} \mathrm{O}_{7}(\mathrm{l})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \quad->\quad 2 \mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{l})
$$

The acid is stored ready for market/sale.

## III. Environmental effects of contact process

Sulphur(VI)oxide and Sulphur(IV)oxide gases are atmospheric pollutants that form acid rain if they escape to the atmosphere.
In the Contact process, about $2 \%$ of these gases do not form sulphuric (VI) acid.

The following precautions prevent/minimize pollution from Contact process:
(i)recycling back any unreacted Sulphur(IV)oxide gas back to the heat exchangers.
(ii)dissolving Sulphur(VI)oxide gas in concentrated sulphuric (VI) acid instead of water.

This prevents the formation of fine droplets of the corrosive/ toxic/poisonous fumes of concentrated sulphuric (VI) acid.
(iii)scrubbing-This involves passing the exhaust gases through very tall chimneys lined with quicklime/calcium hydroxide solid.
This reacts with Sulphur (VI)oxide gas forming harmless calcium(II)sulphate (IV) $/ \mathrm{CaSO}_{3}$

## Chemical equation

$$
\mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{aq})+\mathrm{SO}_{2}(\mathrm{~g}) \quad-->\quad \mathrm{CaSO}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{~g})
$$

## IV. Uses of Sulphuric(VI)acid

Sulphuric (VI) acid is used:
(i) in making dyes and paint
(ii) as acid in Lead-acid accumulator/battery
(iii) for making soapless detergents
(iv) for making sulphate agricultural fertilizers

## VI. Sketch chart diagram showing the Contact process

(c) Properties of Concentrated sulphuric(VI)acid
(i)Concentrated sulphuric(VI)acid is a colourless oily liquid with a density of $1.84 \mathrm{gcm}^{-3}$. It has a boiling point of $338^{\circ} \mathrm{C}$.
(ii) Concentrated sulphuric(VI)acid is very soluble in water.

The solubility /dissolution of the acid very highly exothermic.
The concentrated acid should thus be diluted slowly in excess water.
Water should never be added to the acid because the hot acid scatters highly corrosive fumes out of the container.
(iii) Concentrated sulphuric (VI)acid is a covalent compound. It has no free $\mathrm{H}^{+}$ions.
Free $\mathrm{H}^{+}$ions are responsible for turning the blue litmus paper red.
Concentrated sulphuric (VI) acid thus do not change the blue litmus paper red.
(iv) Concentrated sulphuric (VI)acid is hygroscopic. It absorbs water from the atmosphere and do not form a solution.
This makes concentrated sulphuric (VI) acid very suitable as drying agent during preparation of gases.
(v)The following are some chemical properties of concentrated sulphuric (VI) acid:

## I. As a dehydrating agent

## Experiment I;

Put about four spatula end fulls of brown sugar and glucose in separate 10 cm 3 beaker.
Carefully add about 10 cm 3 of concentrated sulphuric (VI) acid .Allow to stand for about 10 minutes.
Observation;
Colour( in brown sugar )change from brown to black.
Colour (in glucose) change from white to black.
10 cm 3 beaker becomes very hot.
Explanation

Concentrated sulphuric (VI) acid is strong dehydrating agent.
It removes chemically and physically combined elements of water(Hydrogen and Oxygen in ratio 2:1)from compounds.
When added to sugar/glucose a vigorous reaction that is highly exothermic take place.
The sugar/glucose is charred to black mass of carbon because the acid dehydrates the sugar/glucose leaving carbon.

## Caution

This reaction is highly exothermic that start slowly but produce fine particles of carbon that if inhaled cause quick suffocation by blocking the lung villi.

Chemical equation

Sugar: $\mathrm{C}_{12} \mathrm{H}_{22} \mathrm{O}_{11}(\mathrm{~s}) \quad$--conc. $\mathrm{H}_{2} \mathrm{SO}_{4}-->12 \mathrm{C}(\mathbf{s})+11 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$

> (brown) (black)

## Experiment II;

Put about two spatula end full of hydrated copper(II)sulphate(VI)crystals in a boiling tube .Carefully add about 10 cm 3 of concentrated sulphuric (VI) acid .Warm .
Observation;
Colour change from blue to white.

## Explanation

Concentrated sulphuric (VI) acid is strong dehydrating agent.It removes physically combined elements of water(Hydrogen and Oxygen in ratio 2:1)from hydrated compounds.
The acid dehydrates blue copper(II)sulphate to white anhydrous copper(II)sulphate .

Chemical equation

$$
\underset{\text { (blue) }}{\underset{\text { CuSO }}{4} .5 \mathrm{H}_{2} \mathrm{O}(\mathrm{~s})-\text {-conc. } \mathrm{H}_{2} \mathrm{SO}_{4}-->} \underset{\text { (white) }}{\mathrm{CuSO}_{4}(\mathrm{~s})}+5 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

## Experiment III;

Put about 4 cm 3 of absolute ethanol in a boiling tube .Carefully add about 10 cm 3 of concentrated sulphuric (VI) acid.
Place moist/damp/wet filter paper dipped in acidified potassium dichromate(VI)solution on the mouth of the boiling tube. Heat strongly. Caution:
Absolute ethanol is highly flammable.
Observation;
Colourless gas produced.

Orange acidified potassium dichromate (VI) paper turns to green.

## Explanation

Concentrated sulphuric (VI) acid is strong dehydrating agent.
It removes chemically combined elements of water(Hydrogen and Oxygen in ratio $2: 1$ )from compounds.
The acid dehydrates ethanol to ethene gas at about $170^{\circ} \mathrm{C}$.
Ethene with $=\mathrm{C}=\mathrm{C}=$ double bond turns orange acidified potassium dichromate (VI) paper turns to green.

Chemical equation
$\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(\mathrm{l})$--conc. $\mathrm{H}_{2} \mathrm{SO}_{4} / 170^{\circ} \mathrm{C}-->\mathrm{C}_{2} \mathrm{H}_{4}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
NB : This reaction is used for the school laboratory preparation of ethene gas

## Experiment IV;

Put about 4 cm 3 of methanoic acid in a boiling tube .Carefully add about 6 cm 3 of concentrated sulphuric (VI) acid. Heat gently

## Caution:

This should be done in a fume chamber/open Observation;

Colourless gas produced.

## Explanation

Concentrated sulphuric (VI) acid is strong dehydrating agent. It removes chemically combined elements of water (Hydrogen and Oxygen in ratio 2:1)from compounds.
The acid dehydrates methanoic acid to poisonous/toxic carbon(II)oxide gas.
Chemical equation

$$
\mathrm{HCOOH}(\mathrm{l}) \text {--conc. } \mathrm{H}_{2} \mathrm{SO}_{4}-->\mathrm{CO}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

NB: This reaction is used for the school laboratory preparation of small amount carbon (II)oxide gas

## Experiment V;

Put about 4 cm 3 of ethan-1,2-dioic/oxalic acid in a boiling tube .Carefully add about 6 cm 3 of concentrated sulphuric (VI) acid. Pass any gaseous product through lime water.Heat gently

## Caution:

This should be done in a fume chamber/open

## Observation;

Colourless gas produced.
Gas produced forms a white precipitate with lime water.
Explanation
Concentrated sulphuric (VI) acid is strong dehydrating agent.

It removes chemically combined elements of water (Hydrogen and Oxygen in ratio 2:1)from compounds.
The acid dehydrates ethan-1,2-dioic/oxalic acid to a mixture of poisonous/toxic carbon(II)oxide and carbon(IV)oxide gases.

## Chemical equation

$\mathrm{HOOCCOOH}(\mathrm{l})$--conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$--> $\mathrm{CO}(\mathrm{g})+\mathrm{CO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
NB: This reaction is also used for the school laboratory preparation of small amount carbon (II) oxide gas.
Carbon (IV) oxide gas is removed by passing the mixture through concentrated sodium/potassium hydroxide solution.

## II. As an Oxidizing agent

## Experiment I

Put about 2 cm 3 of Concentrated sulphuric (VI) acid into three separate boiling tubes. Place a thin moist/damp/wet filter paper dipped in acidified potassium dichromate (VI)solution on the mouth of the boiling tube. Put about 0.5 g of Copper turnings, Zinc granule and Iron filings to each boiling tube separately.

## Observation;

Effervescence/fizzing/bubbles
Blue solution formed with copper,
Green solution formed with Iron
Colourless solution formed with Zinc
Colourless gas produced that has a pungent irritating choking smell.
Gas produced turn orange moist/damp/wet filter paper dipped in acidified potassium dichromate (VI)solution to green.

## Explanation

Concentrated sulphuric (VI) acid is strong oxidizing agent.
It oxidizes metals to metallic sulphate(VI) salts and itself reduced to sulphur(IV)oxide gas.
Sulphur (IV) oxide gas turn orange moist/damp/wet filter paper dipped in acidified potassium dichromate (VI)solution to green.
$\mathrm{CuSO}_{4}(\mathrm{aq})$ is a blue solution. $\mathrm{ZnSO}_{4}(\mathrm{aq})$ is a colourless solution. $\mathrm{FeSO}_{4}(\mathrm{aq})$ is a green solution.
Chemical equation

$$
\begin{aligned}
\hline \mathrm{Cu}(\mathrm{~s})+2 \mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})--> & \mathrm{CuSO}_{4}(\mathrm{aq})+\mathrm{SO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
\mathrm{Zn}(\mathrm{~s})+2 \mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})--> & \mathrm{ZnSO}_{4}(\mathrm{aq})+\mathrm{SO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
\mathrm{Fe}(\mathrm{~s})+2 \mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})--> & \mathrm{FeSO}_{4}(\mathrm{aq})+\mathrm{SO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
\end{aligned}
$$

## Experiment II

Put about 2 cm 3 of Concentrated sulphuric (VI) acid into two separate boiling tubes. Place a thin moist/damp/wet filter paper dipped in acidified potassium dichromate (VI)solution on the mouth of the boiling tube.
Put about 0.5 g of powdered charcoal and sulphur powder to each boiling tube separately.
Warm.
Observation;
Black solid charcoal dissolves/decrease
Yellow solid sulphur dissolves/decrease
Colourless gas produced that has a pungent irritating choking smell.
Gas produced turn orange moist/damp/wet filter paper dipped in acidified potassium dichromate (VI)solution to green.

## Explanation

Concentrated sulphuric (VI) acid is strong oxidizing agent. It oxidizes nonmetals to non metallic oxides and itself reduced to sulphur(IV)oxide gas. Sulphur (IV) oxide gas turn orange moist/damp/wet filter paper dipped in acidified potassium dichromate (VI)solution to green.
Charcoal is oxidized to carbon(IV)oxide. Sulphur is oxidized to Sulphur(IV)oxide .
Chemical equation

$$
\begin{aligned}
& \mathrm{C}(\mathrm{~s})+2 \mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})-->\mathrm{CO}_{2}(\mathrm{aq})+2 \mathrm{SO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
& \mathrm{S}(\mathrm{~s})+2 \mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})-->\quad 3 \mathrm{SO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
\end{aligned}
$$

## III. As the least volatile acid

Study the table below showing a comparison in boiling points of the three mineral acids

| Mineral acid | Relative molecula mass | Boiling point $\left({ }^{\circ} \mathrm{C}\right)$ |
| :--- | :--- | :--- |
| Hydrochloric acid(HCl) | 36.5 | 35.0 |
| Nitric(V)acid(HNO3) | 63.0 | 83.0 |
| Sulphuric(VI)acid $\left(\mathrm{H}_{2} \mathrm{SO}_{4}\right)$ | 98.0 | 333 |

## 1.Which is the least volatile acid? Explain

Sulphuric(VI)acid( $\mathrm{H}_{2} \mathrm{SO} 4$ ) because it has the largest molecule and joined by Hydrogen bonds making it to have the highest boiling point/least volatile.

## 2. Using chemical equations, explain how sulphuric(VI)acid displaces the less volatile mineral acids.

(i)Chemical equation

$$
\begin{aligned}
& \mathrm{KNO}_{3}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq}) \text {--> } \mathrm{KHSO}_{4}(\mathrm{l})+\mathrm{HNO}_{3}(\mathrm{~g}) \\
& \mathrm{NaNO}_{3}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})-->\mathrm{NaHSO}_{4}(\mathrm{l})+\mathrm{HNO}_{3}(\mathrm{~g})
\end{aligned}
$$

This reaction is used in the school laboratory preparation of Nitric(V) acid $\left(\mathrm{HNO}_{3}\right)$.
(ii)Chemical equation
$\mathrm{KCl}(\mathrm{s})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})$--> $\mathrm{KHSO}_{4}(\mathrm{~s})+\mathrm{HCl}(\mathrm{g})$
$\mathrm{NaCl}(\mathrm{s})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})-->\mathrm{NaHSO}_{4}(\mathrm{~s})+\mathrm{HCl}(\mathrm{g})$
This reaction is used in the school laboratory preparation of Hydrochloric acid ( HCl ).

## (d) Properties of dilute sulphuric(VI)acid.

Dilute sulphuric(VI)acid is made when about 10 cm 3 of concentrated sulphuric (VI) acid is carefully added to about 90 cm 3 of distilled water.

Diluting concentrated sulphuric (VI) acid should be done carefully because the reaction is highly exothermic.
Diluting concentrated sulphuric (VI) acid decreases the number of moles present in a given volume of solution which makes the acid less corrosive.
On diluting concentrated sulphuric(VI) acid, water ionizes /dissociates the acid fully/wholly into two(dibasic)free $\mathrm{H}^{+}(\mathrm{aq})$ and $\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})$ ions:

$$
\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})->2 \mathrm{H}^{+}(\mathrm{aq})+\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})
$$

The presence of free $\mathrm{H}^{+}(\mathrm{aq})$ ions is responsible for ;
(i)turn litmus red because of the presence of free $\mathrm{H}^{+}(\mathrm{aq})$ ions
(ii)have $\mathrm{pH} 1 / 2 / 3$ because of the presence of many free $\mathrm{H}^{+}(\mathrm{aq})$ ions hence a strongly acidic solution.
(iii)Reaction with metals

## Experiment:

Place 5 cm 3 of 0.2 M dilute sulphuric(VI)acid into four separate clean test tubes. Add about 0.1 g of Magnesium ribbon to one test tube. Cover the mixture with a finger as stopper. Introduce a burning splint on top of the finger and release the finger "stopper". Repeat by adding Zinc, Copper and Iron instead of the Magnesium ribbon.

## Observation:

No effervescence/ bubbles/ fizzing with copper
Effervescence/ bubbles/ fizzing with Iron ,Zinc and Magnesium
Colourless gas produced that extinguishes burning splint with a "pop" sound.
Colourless solution formed with Zinc and Magnesium.
Green solution formed with Iron

## Explanation:

When a metal higher than hydrogen in the reactivity/electrochemical series is put in a test tube containing dilute sulphuric(VI)acid,
effervescence/ bubbling/ fizzing takes place with evolution of Hydrogen gas.
Impure hydrogen gas extinguishes burning splint with a "pop" sound. A sulphate (VI) salts is formed. Iron, Zinc and Magnesium are higher than hydrogen in the reactivity/electrochemical series.
They form Iron (II)sulphate(VI), Magnesium sulphate(VI) and Zinc sulphate(VI).
When a metal lower than hydrogen in the reactivity/electrochemical series is put in a test tube containing dilute sulphuric(VI)acid, there is no effervescence/ bubbling/ fizzing that take place.
Copper thus do not react with dilute sulphuric(VI)acid.
Chemical/ionic equation

| $\mathrm{Mg}(\mathrm{s})$ | $+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})$ | $-->\mathrm{MgSO}_{4}(\mathrm{aq})$ | + | $\mathrm{H}_{2}(\mathrm{~g})$ |
| :--- | :--- | :--- | :--- | ---: |
| $\mathrm{Mg}(\mathrm{s})$ | $+2 \mathrm{H}^{+}(\mathrm{aq})$ | $-->\mathrm{Mg}^{2+}(\mathrm{aq})$ | + | $\mathrm{H}_{2}(\mathrm{~g})$ |
| $\mathrm{Zn}(\mathrm{s})$ | $+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})$ | $-->\mathrm{ZnSO}_{4}(\mathrm{aq})$ | + | $\mathrm{H}_{2}(\mathrm{~g})$ |
| $\mathrm{Zn}(\mathrm{s})$ | $+2 \mathrm{H}^{+}(\mathrm{aq})$ | $-->\mathrm{Zn}^{2+}(\mathrm{aq})$ | + | $\mathrm{H}_{2}(\mathrm{~g})$ |
| $\mathrm{Fe}(\mathrm{s})$ | $+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})$ | $-->\mathrm{FeSO}_{4}(\mathrm{aq})$ | + | $\mathrm{H}_{2}(\mathrm{~g})$ |
| $\mathrm{Fe}(\mathrm{s})$ | $+\mathrm{H}^{+}(\mathrm{aq})$ | $-->\mathrm{Fe}^{2+}(\mathrm{aq})$ | + | $\mathrm{H}_{2}(\mathrm{~g})$ |

NB:(i) Calcium,Lead and Barium forms insoluble sulphate(VI)salts that cover/coat the unreacted metals.
(ii)Sodium and Potassium react explosively with dilute sulphuric(VI)acid
(iv)Reaction with metal carbonates and hydrogen carbonates

## Experiment:

Place 5 cm 3 of 0.2 M dilute sulphuric(VI)acid into four separate clean boiling tubes. Add about 0.1 g of sodium carbonate to one boiling tube. Introduce a burning splint on top of the boiling tube. Repeat by adding Zinc carbonate, Copper (II)carbonate and Iron(II)Carbonate in place of the sodium hydrogen carbonate.

## Observation:

Effervescence/ bubbles/ fizzing.
Colourless gas produced that extinguishes burning splint.
Colourless solution formed with Zinc carbonate, sodium hydrogen carbonate and sodium carbonate.
Green solution formed with Iron(II)Carbonate
Blue solution formed with Copper(II)Carbonate
Explanation:
When a metal carbonate or a hydrogen carbonates is put in a test tube containing dilute sulphuric(VI)acid, effervescence/ bubbling/ fizzing takes place with evolution of carbon(IV)oxide gas. carbon(IV)oxide gas
extinguishes a burning splint and forms a white precipitate when bubbled in lime water.
A sulphate (VI) salts is formed.

## Chemical/ionic equation

$$
\begin{aligned}
& \mathrm{ZnCO}_{3}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq}) \text {--> } \mathrm{ZnSO}_{4}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g}) \\
& \mathrm{ZnCO}_{3}(\mathrm{~s})+2 \mathrm{H}^{+}(\mathrm{aq})-->\quad \mathrm{Zn}^{2+}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g}) \\
& \mathrm{CuCO}_{3}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})-->\mathrm{CuSO}_{4}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g}) \\
& \mathrm{CuCO}_{3}(\mathrm{~s})+2 \mathrm{H}^{+}(\mathrm{aq})-->\quad \mathrm{Cu}^{2+}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g}) \\
& \mathrm{FeCO}_{3}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})-->\mathrm{FeSO}_{4}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g}) \\
& \mathrm{FeCO}_{3}(\mathrm{~s})+2 \mathrm{H}^{+}(\mathrm{aq}) \text {--> } \quad \mathrm{Fe}^{2+}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g}) \\
& 2 \mathrm{NaHCO}_{3}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})-->\mathrm{Na}_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+2 \mathrm{CO}_{2}(\mathrm{~g}) \\
& \mathrm{NaHCO}_{3}(\mathrm{~s})+\mathrm{H}^{+}(\mathrm{aq})-->\mathrm{Na}^{+}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g}) \\
& \mathrm{Na}_{2} \mathrm{CO}_{3}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq}) \text {--> } \mathrm{Na}_{2} \mathrm{SO} 4(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g}) \\
& \mathrm{NaHCO}_{3}(\mathrm{~s})+\mathrm{H}^{+}(\mathrm{aq})-->\mathrm{Na}^{+}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g}) \\
& \left(\mathrm{NH}_{4}\right)_{2} \mathrm{CO}_{3}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq}) \text {--> }\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g}) \\
& \left(\mathrm{NH}_{4}\right)_{2} \mathrm{CO}_{3}(\mathrm{~s})+\mathrm{H}^{+}(\mathrm{aq}) \quad-->\mathrm{NH}_{4}{ }^{+}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g}) \\
& 2 \mathrm{NH}_{4} \mathrm{HCO}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq}) \text {--> }\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g}) \\
& \mathrm{NH}_{4} \mathrm{HCO}_{3}(\mathrm{aq})+\mathrm{H}^{+}(\mathrm{aq}) \quad \text {--> } \mathrm{NH}_{4}{ }^{+}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{CO}_{2}(\mathrm{~g})
\end{aligned}
$$

NB:
Calcium, Lead and Barium carbonates forms insoluble sulphate(VI)salts that cover/coat the unreacted metals.
(v)Neutralization-reaction of metal oxides and alkalis/bases

## Experiment I:

Place 5 cm 3 of 0.2 M dilute sulphuric(VI)acid into four separate clean boiling tubes. Add about 0.1 g of copper(II)oxide to one boiling tube. Stir.
Repeat by adding Zinc oxide, calcium carbonate and Sodium (II)Oxide in place of the Copper(II)Oxide.
Observation:
Blue solution formed with Copper(II)Oxide
Colourless solution formed with other oxides
Explanation:
When a metal oxide is put in a test tube containing dilute
sulphuric(VI)acid, the oxide dissolves forming a sulphate (VI) salt.
Chemical/ionic equation

$$
\begin{aligned}
& \mathrm{ZnO}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})-->\mathrm{ZnSO}_{4}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
& \mathrm{ZnO}(\mathrm{~s})+2 \mathrm{H}^{+}(\mathrm{aq})-->\mathrm{Zn}^{2+}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
\end{aligned}
$$

$$
\left.\begin{array}{l}
\mathrm{CuO}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})-->\quad \mathrm{CuSO}_{4}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
\mathrm{CuO}(\mathrm{~s})+2 \mathrm{H}_{+}(\mathrm{aq})--> \\
\mathrm{Cu}
\end{array}\right)
$$

NB:
Calcium, Lead and Barium oxides forms insoluble sulphate(VI)salts that cover/coat the unreacted metals oxides.

## Experiment II:

Fill a burette wuth 0.1 M dilute sulphuric(VI)acid. Pipette 20.0 cm 3 of 0.1 Msodium hydroxide solution into a 250 cm 3 conical flask. Add three drops of phenolphthalein indicator.Titrate the acid to get a permanent colour change.Repeat with 0.1 M potassium hydroxide solution inplace of 0.1 Msodium hydroxide solution
Observation:
Colour of phenolphthalein changes from pink to colourless at the end point.

## Explanation

Like other (mineral) acids dilute sulphuric(VI)acid neutralizes bases/alkalis to a sulphate salt and water only.
Colour of the indicator used changes when a slight excess of acid is added to the base at the end point
Chemical equation:

$$
\begin{aligned}
& 2 \mathrm{NaOH}_{(\mathrm{aq})}+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})-->\mathrm{Na}_{2} \mathrm{SO}_{4}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
& \mathrm{OH}^{-}(\mathrm{s})+\mathrm{H}^{+}(\mathrm{aq})-->\quad \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
& 2 \mathrm{KOH}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})-->\mathrm{K}_{2} \mathrm{SO}_{4}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
& \mathrm{OH}^{-}(\mathrm{s})+\quad \mathrm{H}^{+}(\mathrm{aq})-->\quad \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
& 2 \mathrm{NH}_{4} \mathrm{OH}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})-->\quad\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
& \mathrm{OH}^{-}(\mathrm{s})+\mathrm{H}^{+}(\mathrm{aq})-->\quad \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
\end{aligned}
$$

## (iv) Hydrogen sulphide( $\left.\mathbf{H}_{2} \mathbf{S}\right)$

## (a) Occurrence

Hydrogen sulphide is found in volcanic areas as a gas or dissolved in water from geysers and hot springs in active volcanic areas of the world e.g.
Olkaria and Hells gate near Naivasha in Kenya.
It is present in rotten eggs and human excreta.

## (b) Preparation

Hydrogen sulphide is prepared in a school laboratory by heating Iron (II) sulphide with dilute hydrochloric acid.

## (c) Properties of Hydrogen sulphide(Questions)

1. Write the equation for the reaction for the school laboratory preparation of Hydrogen sulphide.

Chemical equation: $\mathrm{FeS}(\mathrm{s})+2 \mathrm{HCl}(\mathrm{aq}) \quad->\mathrm{H}_{2} \mathrm{~S}(\mathrm{~g}) \mathrm{FeCl}_{2}(\mathrm{aq})$
2. State three physical properties unique to Hydrogen sulphide. Hydrogen sulphide is a colourless gas with characteristic pungent poisonous smell of rotten eggs. It is soluble in cold water but insoluble in warm water. It is denser than water and turns blue litmus paper red.
3. Hydrogen sulphide exist as a dibasic acid when dissolved in water. Using a chemical equation show how it ionizes in aqueous state.

$$
\begin{array}{lll}
\mathrm{H}_{2} \mathrm{~S}(\mathrm{aq}) & -> & \mathrm{H}^{+}(\mathrm{aq})+\mathrm{HS}^{-}(\mathrm{aq}) \\
\mathrm{H}_{2} \mathrm{~S}(\mathrm{aq}) & & -> \\
2 \mathrm{H}^{+}(\mathrm{aq})+\mathrm{S}^{2-}(\mathrm{aq})
\end{array}
$$

Hydrogen sulphide therefore can form both normal and acid salts e.g
Sodium hydrogen sulphide and sodium sulphide both exist
4. State and explain one gaseous impurity likely to be present in the gas jar containing hydrogen sulphide above.

Hydrogen/ $\mathrm{H}_{2}$
Iron(II)sulphide contains Iron as impurity . The iron will react with dilute hydrochloric acid to form iron(II)chloride and produce hydrogen gas that mixes with hydrogen sulphide gas.
5. State and explain the observations made when a filter paper dipped in Lead(II) ethanoate /Lead (II) nitrate(V) solution is put in a gas jar containing hydrogen sulphide gas.
Observations
Moist Lead(II) ethanoate /Lead (II) nitrate(V) paper turns black.

## Explanation

When hydrogen sulphide is bubbled in a metallic salt solution, a metallic sulphide is formed.
All sulphides are insoluble black salts except sodium sulphide, potassium sulphide and ammonium sulphides.
Hydrogen sulphide gas blackens moist Lead (II) ethanoate /Lead (II) nitrate(V) paper .
The gas reacts with $\mathrm{Pb}^{2+}$ in the paper to form black Lead(II)sulphide.
This is the chemical test for the presence of $\mathrm{H}_{2} \mathrm{~S}$ other than the physical smell of rotten eggs.
Chemical equations

| $\mathrm{Pb}^{2+}(\mathrm{aq})$ | $+\mathrm{H}_{2} \mathrm{~S}$ | $->\mathrm{PbS}$ <br> (black) | $+2 \mathrm{H}+(\mathrm{aq})$ |
| :--- | :--- | :--- | :--- |
| $\mathrm{Fe}^{2+}(\mathrm{aq})$ | $+\mathrm{H}_{2} \mathrm{~S}$ | $->\mathrm{FeS}$ <br> (black) | $+2 \mathrm{H}+(\mathrm{aq})$ |
| $\mathrm{Zn}^{2+}(\mathrm{aq})$ | $+\mathrm{H}_{2} \mathrm{~S}$ | $->\mathrm{ZnS}$ <br> (black) | $+2 \mathrm{H}+(\mathrm{aq})$ |
| $\mathrm{Cu}^{2+}(\mathrm{aq})$ | $+\mathrm{H}_{2} \mathrm{~S}$ | $->\mathrm{CuS}$ <br> (black) | $+2 \mathrm{H}+(\mathrm{aq})$ |

$$
2 \mathrm{Cu}^{+}(\mathrm{aq}) \quad+\mathrm{H}_{2} \mathrm{~S} \quad->\mathrm{Cu}_{2} \mathrm{~S} \quad+2 \mathrm{H}+(\mathrm{aq})
$$

## 6. Dry hydrogen sulphide was ignited as below.

Dry Hydrogen sulphide gas

## (i) State the observations made in flame A

Hydrogen sulphide burns in excess air with a blue flame to form sulphur(IV)oxide gas and water.
Chemical equation: $2 \mathrm{H}_{2} \mathrm{~S}(\mathrm{~g})+3 \mathrm{O}_{2}(\mathrm{~g})->2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+2 \mathrm{SO}_{2}(\mathrm{~g})$
Hydrogen sulphide burns in limited air with a blue flame to form sulphur solid and water.
Chemical equation: $\quad 2 \mathrm{H}_{2} \mathrm{~S}(\mathrm{~g}) \quad+\mathrm{O}_{2}(\mathrm{~g}) \quad \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+2 \mathrm{~S}(\mathrm{~s})$

## 7. Hydrogen sulphide is a strong reducing agent that is oxidized to yellow solid sulphur as precipitate. The following experiments illustrate the reducing properties of Hydrogen sulphide.

## (a)Turns Orange acidified potassium dichromate(VI) to green

## Experiment:

(i)Pass a stream of Hydrogen sulphide gas in a test tube containing acidified potassium dichromate (VI) solution. or;
(ii)Dip a filter paper soaked in acidified potassium dichromate (VI) into a gas jar containing Hydrogen sulphide gas.

## Observation:

Orange acidified potassium dichromate (VI) turns to green.
Yellow solid residue.

## Explanation:

Hydrogen sulphide gas reduces acidified potassium dichromate(VI) from orange $\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}$ ions to green $\mathrm{Cr}^{3+}$ ions leaving a yellow solid residue as itself is oxidized to sulphur.

Chemical/ionic equation:
$4 \mathrm{H}_{2} \mathrm{~S}(\mathrm{aq})+\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}(\mathrm{aq})+6 \mathrm{H}+(\mathrm{aq})->4 \mathrm{~S}(\mathrm{aq})+2 \mathrm{Cr}^{3+}(\mathrm{aq})+7 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
This test is used for differentiating Hydrogen sulphide and sulphur (IV)oxide gas.

Sulphur(IV)oxide also reduces acidified potassium dichromate(VI) from orange $\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}$ ions to green $\mathrm{Cr}^{3+}$ ions without leaving a yellow residue.

## (b)Decolorizes acidified potassium manganate(VII)

## Experiment:

(i)Pass a stream of Sulphur(IV) oxide gas in a test tube containing acidified potassium manganate(VII) solution. or;
(ii)Dip a filter paper soaked in acidified potassium manganate(VII) into a gas jar containing Hydrogen Sulphide gas.

## Observation:

Purple acidified potassium manganate(VII) turns to colourless/ acidified potassium manganate(VII) is decolorized. Yellow solid residue.

## Explanation:

Hydrogen sulphide gas reduces acidified potassium manganate(VII) from purple $\mathrm{MnO}_{4}^{-}$ions to green $\mathrm{Mn}^{2+}$ ions leaving a residue as the gas itself is oxidized to sulphur.
Chemical/ionic equation:

$$
\underset{\text { (purple) }}{5 \mathrm{H}_{2} \mathrm{~S}(\mathrm{~g})+\underset{4}{2 \mathrm{MnO}_{4}^{-}(\mathrm{aqq})}+6 \mathrm{H}+(\mathrm{aq}) \quad->} \underset{\text { (colourless) }}{5 \mathrm{~S}(\mathrm{~s})+2 \mathrm{Mn}^{2+}(\mathrm{aq})}+8 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

This is another test for differentiating Hydrogen sulphide and Sulphur(IV) oxide gas.
Sulphur(IV) oxide also decolorizes acidified potassium manganate(VII) from purple $\mathrm{MnO}_{4}^{-}$ions to colourless $\mathrm{Mn}^{2+}$ ions leaving no yellow residue.

## (c)Decolorizes bromine water

## Experiment:

(i)Pass a stream of Hydrogen sulphide gas in a test tube containing bromine water . or;
(ii)Put three drops of bromine water into a gas jar containing Hydrogen sulphide gas. Swirl.

## Observation:

Yellow bromine water turns to colourless/ bromine water is decolorized.
Yellow solid residue

## Explanation:

Hydrogen sulphide gas reduces yellow bromine water to colourless hydrobromic acid $(\mathrm{HBr})$ leaving a yellow residue as the gas itself is oxidized to sulphur.

Chemical/ionic equation:

$$
\begin{array}{llll}
\hline \mathrm{H}_{2} \mathrm{~S}(\mathrm{~g}) & +\underset{\text { (yellow solution) }}{+\mathrm{Br}_{2}(\mathrm{aq})} & -> & \mathrm{S}(\mathrm{~s})+ \\
\text { (yellow solid) }
\end{array} \quad \begin{aligned}
& \text { (colourless) }
\end{aligned}
$$

This is another test for differentiating Hydrogen sulphide and Sulphur(IV) oxide gas.
Sulphur(IV) oxide also decolorizes acidified potassium manganate(VII) from purple $\mathrm{MnO}_{4}{ }^{-}$ions to colourless $\mathrm{Mn}^{2+}$ ions leaving no yellow residue.
$3+2+$ (d) Reduces Iron(III) Fe salts to Iron(II) salts Fe
(i)Pass a stream of Hydrogen sulphide gas in a test tube containing about 3 cm 3 of Iron (III)chloride solution. or;
(ii)Place about 3 cm 3 of Iron (III)chloride solution into a gas jar containing Hydrogen sulphide gas. Swirl.

Observation:
Yellow/brown Iron (III)chloride solution turns to green.
Yellow solid solid

## Explanation:

Hydrogen sulphide gas reduces Iron (III)chloride solution from yellow/brown $\mathrm{Fe}^{3+}$ ions to green $\mathrm{Fe}^{2+}$ ions leaving a yellow residue. The gas is itself oxidized to sulphur.

Chemical/ionic equation:

$$
\underset{\text { (yellow solution) }}{\mathrm{H}_{2} \mathrm{~S}(\mathrm{aq})}+2 \mathrm{Fe}^{3+}(\mathrm{aq}) \underset{\text { (yellow residue) }}{->} \underset{\text { (green) }}{\mathrm{S}(\mathrm{~s})+} \underset{\mathrm{Fe}^{2+}(\mathrm{aq})}{\mathrm{F}^{2}}+2 \mathrm{H}^{+}(\mathrm{aq})
$$

## (e)Reduces Nitric(V)acid to Nitrogen(IV)oxide gas <br> Experiment:

(i)Pass a stream of Hydrogen sulphide gas in a test tube containing about 3 cm 3 of concentrated nitric(V)acid. or;
(ii)Place about 3 cm 3 of concentrated nitric(V)acid into a gas jar containing Hydrogen sulphide gas. Swirl.

Observation:
Brown fumes of a gas evolved/produced.
Yellow solid residue

## Explanation:

Hydrogen sulphide gas reduces concentrated nitric(V)acid to brown nitrogen(IV)oxide gas itself oxidized to yellow sulphur.

Chemical/ionic equation:
$\mathrm{H}_{2} \mathrm{~S}(\mathrm{~g})+2 \mathrm{HNO}_{3}(\mathrm{l}) \quad->2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \quad+\mathrm{S}(\mathrm{s}) \quad+2 \mathrm{NO}_{2}(\mathrm{~g})$

## (f)Reduces sulphuric(VI)acid to Sulphur <br> Experiment:

(i)Pass a stream of Hydrogen sulphide gas in a test tube containing about 3 cm 3 of concentrated sulphuric(VI)acid. or;
(ii)Place about 3 cm 3 of concentrated sulphuric (VI) acid into a gas jar containing Hydrogen sulphide gas. Swirl.

## Observation:

Yellow solid residue

## Explanation:

Hydrogen sulphide gas reduces concentrated sulphuric(VI)acid to yellow sulphur.

Chemical/ionic equation:

$$
3 \mathrm{H}_{2} \mathrm{~S}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{l}) \quad->\quad 4 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \quad \begin{aligned}
& +4 \mathrm{~S}(\mathrm{~s}) \\
& \text { (yellow residue) }
\end{aligned}
$$

## (g)Reduces Hydrogen peroxide to water

## Experiment:

(i)Pass a stream of Hydrogen sulphide gas in a test tube containing about 3 cm 3 of 20 volume hydrogen peroxide.
Observation:
Yellow solid residue

## Explanation:

Hydrogen sulphide gas reduces 20 volume hydrogen peroxide to water and itself oxidized to yellow sulphur
Chemical/ionic equation:

$$
\mathrm{H}_{2} \mathrm{~S}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}_{2}(\mathrm{l})->2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \quad+\quad \underset{\text { (yellow residue) }}{\mathrm{S}(\mathrm{~s})}
$$

## 8.Name the salt formed when:

## (i)equal volumes of equimolar hydrogen sulphide neutralizes sodium hydroxide solution:

Sodium hydrogen sulphide
Chemical/ionic equation:

$$
\mathrm{H}_{2} \mathrm{~S}(\mathrm{~g})+\mathrm{NaOH}(\mathrm{l}) \quad \text {-> } \quad \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\quad \mathrm{NaHS}(\mathrm{aq})
$$

(ii) hydrogen sulphide neutralizes excess concentrated sodium hydroxide solution:
Sodium sulphide
Chemical/ionic equation:
$\mathrm{H}_{2} \mathrm{~S}(\mathrm{~g})+2 \mathrm{NaOH}(\mathrm{l}) \quad->\quad 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \quad+\quad \mathrm{Na}_{2} \mathrm{~S}(\mathrm{aq})$

## Practice

Hydrogen sulphide gas was bubbled into a solution of metallic nitrate( V )salts as in the flow chart below

(b)Identify the cation responsible for the formation of:
I. Blue solution
II. Green solution
III. Brown solution
$\mathrm{Cu}^{2+}(\mathrm{aq})$
$\mathrm{Fe}^{2+}(\mathrm{aq})$
$\mathrm{Fe}^{3+}(\mathrm{aq})$
(c)Using acidified potassium dichromate(VI) describe how you would differentiate between sulphur(IV)Oxide and hydrogen sulphide
-Bubble the gases in separate test tubes containing acidified Potassium dichromate(VI) solution.
-Both changes the Orange colour of acidified Potassium dichromate(VI) solution to green.
-Yellow solid residue/deposit is formed with Hydrogen sulphide Chemical/ionic equation:
$4 \mathrm{H}_{2} \mathrm{~S}(\mathrm{aq})+\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}(\mathrm{aq})+6 \mathrm{H}+(\mathrm{aq})->4 \mathrm{~S}(\mathrm{aq})+2 \mathrm{Cr}^{3+}(\mathrm{aq})+7 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
$3 \mathrm{SO}_{3}{ }^{2-}(\mathrm{aq})+\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}(\mathrm{aq})+8 \mathrm{H}+(\mathrm{aq})->3 \mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})+2 \mathrm{Cr}^{3+}(\mathrm{aq})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
(d)State and explain the observations made if a burning splint is introduced at the mouth of a hydrogen sulphide generator.

ObservationGas continues burning with a blue flame
Explanation: Hydrogen sulphide burns in excess air with a blue flame to form sulphur(IV)oxide gas and water.

Chemical equation: $2 \mathrm{H}_{2} \mathrm{~S}(\mathrm{~g})+3 \mathrm{O}_{2}(\mathrm{~g})->2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})+2 \mathrm{SO}_{2}(\mathrm{~g})$

## (v)Sulphate (VI) ( $\mathrm{SO}_{4}{ }^{2-}$ ) and Sulphate(IV) $\left(\mathrm{SO}_{3}{ }^{2-}\right)$ salts

1. Sulphate (VI) $\left(\mathrm{SO}_{4}{ }^{2-}\right)$ salts are normal and acid salts derived from Sulphuric (VI)acid $\mathrm{H}_{2} \mathrm{SO}_{4}$.
2. Sulphate(IV) $\left(\mathrm{SO}_{3}{ }^{2-}\right)$ salts are normal and acid salts derived from Sulphuric (IV)acid $\mathrm{H}_{2} \mathrm{SO}_{3}$.
3. Sulphuric (VI)acid $\mathrm{H}_{2} \mathrm{SO}_{4}$ is formed when sulphur(VI)oxide gas is bubbled in water.
The acid exist as a dibasic acid with two ionisable hydrogen. It forms therefore the Sulphate (VI) $\left(\mathrm{SO}_{4}{ }^{2-}\right)$ and hydrogen sulphate (VI) $\left(\mathrm{HSO}_{4}{ }^{-}\right)$salts.
i.e.

$$
\begin{aligned}
& \mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})->2 \mathrm{H}^{+}(\mathrm{aq})+\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq}) \\
& \mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})->\mathrm{H}^{+}(\mathrm{aq})+\mathrm{HSO}_{4}^{-}(\mathrm{aq})
\end{aligned}
$$

All Sulphate (VI) ( $\mathrm{SO}_{4}{ }^{2-}$ ) salts dissolve in water/are soluble except Calcium (II) sulphate (VI) ( $\mathrm{CaSO}_{4}$ ), Barium (II) sulphate (VI) $\left(\mathrm{BaSO}_{4}\right)$ and Lead (II)

All Hydrogen sulphate (VI) $\left(\mathrm{HSO}_{3}{ }^{-}\right)$salts exist in solution/dissolved in water. Sodium (I) hydrogen sulphate (VI) ( $\mathrm{NaHSO}_{4}$ ), Potassium (I) hydrogen sulphate (VI) ( $\mathrm{KHSO}_{4}$ ) and Ammonium hydrogen sulphate (VI) ( $\mathrm{NH}_{4} \mathrm{HSO}_{4}$ ) exist also as solids.
Other Hydrogen sulphate (VI) ( $\mathrm{HSO}_{4}{ }^{-}$) salts do not exist except those of Calcium (II) hydrogen sulphate (VI) $\left(\mathrm{Ca}\left(\mathrm{HSO}_{4}\right)_{2}\right)$ and Magnesium (II) hydrogen sulphate (VI) (Mg (HSO4)2).
4. Sulphuric (IV)acid $\mathrm{H}_{2} \mathrm{SO}_{3}$ is formed when sulphur(IV)oxide gas is bubbled in water.
The acid exist as a dibasic acid with two ionisable hydrogen. It forms therefore the Sulphate (IV) $\left(\mathrm{SO}_{3}{ }^{2-}\right)$ and hydrogen sulphate (VI) $\left(\mathrm{HSO}_{4}{ }^{-}\right)$salts. i.e.

$$
\mathrm{H}_{2} \mathrm{SO}_{3}(\mathrm{aq})->2 \mathrm{H}^{+}(\mathrm{aq})+\mathrm{SO}_{3}{ }^{2-}(\mathrm{aq})
$$

$$
\mathrm{H}_{2} \mathrm{SO}_{3}(\mathrm{aq})->\mathrm{H}^{+}(\mathrm{aq})+\mathrm{HSO}_{3}^{-}(\mathrm{aq})
$$

All Sulphate (IV) ( $\mathrm{SO}_{3}{ }^{2-}$ ) salts dissolve in water/are soluble except Calcium (II) sulphate (IV) $\left(\mathrm{CaSO}_{3}\right)$, Barium (II) sulphate (IV) $\left(\mathrm{BaSO}_{3}\right)$ and Lead (II)

All Hydrogen sulphate (IV) $\left(\mathrm{HSO}_{3}{ }^{-}\right)$salts exist in solution/dissolved in water. Sodium (I) hydrogen sulphate (IV) $\left(\mathrm{NaHSO}_{3}\right)$, Potassium (I) hydrogen sulphate (IV) ( $\mathrm{KHSO}_{3}$ ) and Ammonium hydrogen sulphate (IV) $\left(\mathrm{NH}_{4} \mathrm{HSO}_{3}\right)$ exist also as solids.
Other Hydrogen sulphate (IV) $\left(\mathrm{HSO}_{3}{ }^{-}\right)$salts do not exist except those of Calcium (II) hydrogen sulphate (IV) $\left(\mathrm{Ca}\left(\mathrm{HSO}_{3}\right)_{2}\right)$ and Magnesium (II) hydrogen sulphate (IV) $\left(\mathrm{Mg}\left(\mathrm{HSO}_{3}\right)_{2}\right)$.
5.The following experiments show the effect of heat on sulphate(VI) ( $\mathrm{SO}_{4}{ }^{2-}$ )and sulphate(IV) ( $\mathrm{SO}_{3}{ }^{2-}$ ) salts:

## Experiment:

In a clean dry test tube place separately about 1.0 g of :
Zinc(II)sulphate (VI), Iron(II)sulphate(VI), Copper(II)sulphate(VI),Sodium
(I) sulphate (VI), Sodium (I) sulphate (IV).Heat gently then strongly. Test any gases produced using litmus papers.

## Observations:

-Colourless droplets of liquid forms on the cooler parts of the test tube in all cases.
-White solid residue is left in case of Zinc (II)sulphate(VI),Sodium (I) sulphate (VI) and Sodium (I) sulphate (IV).
-Colour changes from green to brown /yellow in case of Iron (II)sulphate(VI)
-Colour changes from blue to white then black in case of Copper (II) sulphate (VI)
-Blue litmus paper remain and blue and red litmus paper remain red in case of Zinc(II)sulphate(VI), Sodium (I) sulphate (VI) and Sodium (I) sulphate (IV) Blue litmus paper turns red and red litmus paper remain red in case of Iron (II)sulphate(VI) and Copper (II) sulphate (VI).

## Explanation

(i)All Sulphate (VI) $\left(\mathrm{SO}_{4}{ }^{2-}\right)$ salts exist as hydrated salts with water of crystallization that condenses and collects on cooler parts of test tube as a colourless liquid on gentle heating. e.g.

$$
\begin{array}{lll}
\mathrm{K}_{2} \mathrm{SO}_{4} .10 \mathrm{H}_{2} \mathrm{O}(\mathrm{~s}) & -> & \mathrm{K}_{2} \mathrm{SO}_{4}(\mathrm{~s})+10 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
\mathrm{Na}_{2} \mathrm{SO}_{4} .10 \mathrm{H}_{2} \mathrm{O}(\mathrm{~s}) & -> & \mathrm{Na}_{2} \mathrm{SO}_{4}(\mathrm{~s})+10 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
\mathrm{MgSO}_{4} 7 \mathrm{H}_{2} \mathrm{O}(\mathrm{~s}) & -> & \mathrm{MgSO}_{4}(\mathrm{~s})+7 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
\mathrm{CaSO}_{4} .7 \mathrm{H}_{2} \mathrm{O}(\mathrm{~s})-> & & \mathrm{CaSO}_{4}(\mathrm{~s})+7 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
\mathrm{ZnSO}_{4} .7 \mathrm{H}_{2} \mathrm{O}(\mathrm{~s}) & -> & \mathrm{ZnSO}_{4}(\mathrm{~s})+7 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
\mathrm{FeSO}_{4} .7 \mathrm{H}_{2} \mathrm{O}(\mathrm{~s}) & -> & \mathrm{FeSO}_{4}(\mathrm{~s})+7 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
\mathrm{Al}_{2}\left(\mathrm{SO}_{4}\right)_{3} .6 \mathrm{H}_{2} \mathrm{O}(\mathrm{~s}) & -> & \mathrm{Al}_{2}\left(\mathrm{SO}_{4}\right)_{3}(\mathrm{~s})+6 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
\end{array}
$$

$$
\mathrm{CuSO}_{4} .5 \mathrm{H}_{2} \mathrm{O}(\mathrm{~s}) \quad->\quad \mathrm{CuSO}_{4}(\mathrm{~s})+5 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

All Sulphate (VI) (SO42-) salts do not decompose on heating except Iron (II) sulphate (VI) and Copper (II) sulphate (VI).
(i)Iron (II) sulphate (VI) decomposes on strong heating to produce acidic sulphur (IV)oxide and sulphur(VI)oxide gases. Iron(III)oxide is formed as a brown /yellow residue.
Chemical equation

$$
2 \mathrm{FeSO}_{4}(\mathrm{~s})->\quad \mathrm{Fe}_{2} \mathrm{O}_{3}(\mathrm{~s})+\mathrm{SO}_{2}(\mathrm{~g})+\mathrm{SO}_{3}(\mathrm{~g})
$$

This reaction is used for the school laboratory preparation of small amount of sulphur(VI)oxide gas.
Sulphur (VI) oxide readily /easily solidifies as white silky needles when the mixture is passed through freezing mixture/ice cold water. Sulphur (IV) oxide does not.
(ii) Copper(II)sulphate(VI) decomposes on strong heating to black copper (II) oxide and Sulphur (VI) oxide gas.
Chemical equation

$$
2 \mathrm{CuSO}_{4}(\mathrm{~s})->\mathrm{CuO}(\mathrm{~s})+\mathrm{SO}_{3}(\mathrm{~g})
$$

This reaction is used for the school laboratory preparation of small amount of sulphur(VI)oxide gas.
6. The following experiments show the test for the presence of sulphate (VI) $\left(\mathrm{SO}_{4}{ }^{2-}\right)$ and sulphate(IV) $\left(\mathrm{SO}_{3}{ }^{2-}\right)$ ions in a sample of a salt/compound:

Experiments/Observations:

## (a)Using Lead(II)nitrate(V)

I. To about 5 cm 3 of a salt solution in a test tube add four drops of Lead(II)nitrate(V)solution. Preserve.

| Observation | Inference |
| :--- | :--- |
| White precipitate/ppt | $\mathrm{SO}_{4}{ }^{2-}, \mathrm{SO}_{3}{ }^{2-}, \mathrm{CO}_{3}{ }^{2-}, \mathrm{Cl}^{-}$ions |

II. To the preserved sample in (I) above, add six drops of 2 M nitric(V) acid . Preserve.

Observation 1

| Observation | Inference |
| :--- | :--- |
| White precipitate/ppt persists | $\mathrm{SO}_{4}{ }^{2-}, \mathrm{Cl}^{-}$ions |

Observation 2

| Observation | Inference |
| :--- | :--- |
| White precipitate/ppt dissolves | $\mathrm{SO}_{3}{ }^{2-}, \mathrm{CO}_{3}{ }^{2-}$, ions |

III.(a)To the preserved sample observation 1 in (II) above, Heat to boil.

Observation 1

| Observation | Inference |
| :--- | :--- |
| White precipitate/ppt persists on boiling | $\mathrm{SO}_{4}{ }^{L-}$ ions |

## Observation 2

| Observation | Inference |
| :--- | :--- |
| White precipitate/ppt dissolves on boiling | $\mathrm{Cl}^{-}$ions |

.(b)To the preserved sample observation 2 in (II) above, add 4 drops of acidified potassium manganate(VII) /dichromate(VI).

Observation 1

| Observation | Inference |
| :--- | :--- |
| (i)acidified potassium manganate(VII)decolorized <br> (ii)Orange colour of acidified potassium <br> dichromate(VI) turns to green | $\mathrm{SO}_{3}{ }^{2-}$ ions |

Observation 2

| Observation | Inference |
| :--- | :--- |
| (i)acidified potassium manganate(VII) not <br> decolorized <br> (ii)Orange colour of acidified potassium <br> dichromate(VI) does not turns to green | $\mathrm{CO}_{3}{ }^{2-}$ ions |

Experiments/Observations:
(b)Using Barium(II)nitrate(V)/ Barium(II)chloride
I. To about 5 cm 3 of a salt solution in a test tube add four drops of Barium(II) nitrate (V) / Barium(II)chloride. Preserve.

| Observation | Inference |
| :--- | :--- |
| White precipitate/ppt | $\mathrm{SO}_{4}{ }^{2-}, \mathrm{SO}_{3}{ }^{2-}, \mathrm{CO}_{3}{ }^{2-}$ ions |

II. To the preserved sample in (I) above, add six drops of 2M nitric(V) acid . Preserve.

Observation 1

| Observation | Inference |
| :--- | :--- |
| White precipitate/ppt persists | $\mathrm{SO}_{4}{ }^{2-}$, ions |

Observation 2

| Observation | Inference |
| :--- | :--- |
| White precipitate/ppt dissolves | $\mathrm{SO}_{3}{ }^{2-}, \mathrm{CO}_{3}{ }^{2-}$, ions |

III.To the preserved sample observation 2 in (II) above, add 4 drops of acidified potassium manganate(VII) /dichromate(VI).

Observation 1

| Observation | Inference |
| :--- | :--- |
| (i)acidified potassium manganate(VII)decolorized <br> (ii)Orange colour of acidified potassium <br> dichromate(VI) turns to green | $\mathrm{SO}_{3}{ }^{2-}$ ions |

Observation 2

| Observation | Inference |
| :--- | :--- |
| (i)acidified potassium manganate(VII) not <br> decolorized <br> (ii)Orange colour of acidified potassium <br> dichromate(VI) does not turns to green | $\mathrm{CO}_{3}^{2-}$ ions |

## Explanations

## Using Lead(II)nitrate(V)

(i)Lead(II)nitrate(V) solution reacts with chlorides $\left(\mathrm{Cl}^{-}\right)$, Sulphate (VI) salts ( $\mathrm{SO}_{4}{ }^{2-}$ ), Sulphate (IV)salts $\left(\mathrm{SO}_{3}{ }^{2-}\right.$ ) and carbonates $\left(\mathrm{CO}_{3}{ }^{2-}\right)$ to form the insoluble white precipitate of Lead(II)chloride, Lead(II)sulphate(VI), Lead(II) sulphate (IV) and Lead(II)carbonate(IV).
Chemical/ionic equation:

$$
\begin{array}{lllll}
\mathrm{Pb}^{2+}(\mathrm{aq}) & + & \mathrm{Cl}^{-}(\mathrm{aq}) & -> & \mathrm{PbCl}_{2}(\mathrm{~s}) \\
\mathrm{Pb}^{2+}(\mathrm{aq}) & + & \mathrm{SO}_{4}^{2+}(\mathrm{aq}) & -> & \mathrm{PbSO}_{4}(\mathrm{~s}) \\
\mathrm{Pb}^{2+}(\mathrm{aq}) & + & \mathrm{SO}_{3}^{2+}(\mathrm{aq}) & -> & \mathrm{PbSO}_{3}(\mathrm{~s}) \\
\mathrm{Pb}^{2+}(\mathrm{aq}) & + & \mathrm{CO}_{3}^{2+}(\mathrm{aq}) & -> & \mathrm{PbCO}_{3}(\mathrm{~s})
\end{array}
$$

(ii)When the insoluble precipitates are acidified with nitric(V) acid,

- Lead(II)chloride and Lead(II)sulphate(VI) do not react with the acid and thus their white precipitates remain/ persists.
- Lead(II) sulphate (IV) and Lead(II)carbonate(IV) reacts with the acid to form soluble Lead(II) nitrate (V) and produce/effervesces/fizzes/bubbles out sulphur(IV)oxide and carbon(IV)oxide gases respectively.
. Chemical/ionic equation:
$\mathrm{PbSO}_{3}(\mathrm{~s})+2 \mathrm{H}^{+}(\mathrm{aq}) \quad->\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{Pb}^{2+}(\mathrm{aq})+\mathrm{SO}_{2}(\mathrm{~g})$
$\mathrm{PbCO}_{3}(\mathrm{~s})+2 \mathrm{H}^{+}(\mathrm{aq}) \quad->\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{Pb}^{2+}(\mathrm{aq})+\mathrm{CO}_{2}(\mathrm{~g})$
(iii)When Lead(II)chloride and Lead(II)sulphate(VI) are heated/warmed;
- Lead(II)chloride dissolves in hot water/on boiling(recrystallizes on cooling)
- Lead(II)sulphate(VI) do not dissolve in hot water thus its white precipitate persists/remains on heating/boiling.
(iv)When sulphur(IV)oxide and carbon(IV)oxide gases are produced;
- sulphur(IV)oxide will decolorize acidified potassium manganate(VII) and / or Orange colour of acidified potassium dichromate(VI) will turns to green. Carbon(IV)oxide will not.

Chemical equation:

$$
\begin{gathered}
\mathrm{SO}_{3}^{2-}(\mathrm{aq})+\underset{\text { (purple) }}{2 \mathrm{MnO}_{4}^{-}}(\mathrm{aq})+6 \mathrm{H}+(\mathrm{aq}) \quad->5 \mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})+\underset{(\text { colourless })}{2 \mathrm{Mn}^{2+}(\mathrm{aq})}+3 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
3 \mathrm{SO}_{3}^{2-}(\mathrm{aq})+\underset{(\text { Orange })}{\mathrm{CrO}_{7}^{2-}(\mathrm{aq})}+8 \mathrm{H}+(\mathrm{aq})->3 \mathrm{SO}_{4}{ }^{2-( }(\mathrm{aq})+\underset{(\text { green })}{2 \mathrm{Cr}^{3+}(\mathrm{aq})}+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
\end{gathered}
$$

- Carbon(IV)oxide forms an insoluble white precipitate of calcium carbonate if three drops of lime water are added into the reaction test tube when effervescence is taking place. Sulphur(IV)oxide will not.

Chemical equation:

$$
\mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{aq})+\mathrm{CO}_{2}(\mathrm{~g})-\mathrm{CaCO}_{3}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

These tests should be done immediately after acidifying to ensure the gases produced react with the oxidizing agents/lime water.

## Using Barium(II)nitrate(V)/ Barium(II)Chloride

(i)Barium(II)nitrate(V) and/ or Barium(II)chloride solution reacts with Sulphate (VI) salts $\left(\mathrm{SO}_{4}{ }^{2-}\right)$, Sulphate (IV) salts $\left(\mathrm{SO}_{3}{ }^{2-}\right)$ and carbonates $\left(\mathrm{CO}_{3}{ }^{2-}\right)$ to form the insoluble white precipitate of Barium(II)sulphate(VI), Barium(II) sulphate (IV) and Barium(II)carbonate(IV).

Chemical/ionic equation:

| $\mathrm{Ba}^{2+}(\mathrm{aq})$ | + | $\mathrm{SO}_{4}{ }^{2+}(\mathrm{aq})$ | $->$ |
| :--- | :--- | :--- | :--- |
| $\mathrm{BaSO}_{4}(\mathrm{~s})$ |  |  |  |
| $\mathrm{Ba}^{2+}(\mathrm{aq})$ | + | $\mathrm{SO}_{3}{ }^{2+}(\mathrm{aq})$ | $->$ |
| $\mathrm{Ba}^{2+}(\mathrm{aq})$ | $+\mathrm{BaSO}_{3}(\mathrm{~s})$ |  |  |
| $\mathrm{CO}_{3}{ }^{2+}(\mathrm{aq})$ | $->$ | $\mathrm{BaCO}_{3}(\mathrm{~s})$ |  |

(ii)When the insoluble precipitates are acidified with nitric(V) acid,

- Barium (II)sulphate(VI) do not react with the acid and thus its white precipitates remain/ persists.
- Barium(II) sulphate (IV) and Barium(II)carbonate(IV) reacts with the acid to form soluble Barium(II) nitrate (V) and produce /effervesces /fizzes/ bubbles out sulphur(IV)oxide and carbon(IV)oxide gases respectively.
. Chemical/ionic equation:

```
\(\mathrm{BaSO}_{3}(\mathrm{~s})+2 \mathrm{H}^{+}(\mathrm{aq}) \quad->\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{Ba}^{2+}(\mathrm{aq})+\mathrm{SO}_{2}(\mathrm{~g})\)
    \(\mathrm{BaCO}_{3}(\mathrm{~s})+2 \mathrm{H}^{+}(\mathrm{aq}) \quad->{ }_{2} \mathrm{O}(\mathrm{l})+\mathrm{Ba}^{2+}(\mathrm{aq})+\mathrm{CO}_{2}(\mathrm{~g})\)
```

(iii) When sulphur(IV)oxide and carbon(IV)oxide gases are produced;

- sulphur(IV)oxide will decolorize acidified potassium manganate(VII) and / or Orange colour of acidified potassium dichromate(VI) will turns to green. Carbon(IV)oxide will not.

Chemical equation:

$$
\begin{aligned}
& \overline{5 S O}_{3}{ }^{2-}(\mathrm{aq})+2 \mathrm{MnO}_{4}{ }^{-}(\mathrm{aq})+6 \mathrm{H}+(\mathrm{aq}) \quad->5 \mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})+2 \mathrm{Mn}^{2+}(\mathrm{aq})+3 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
& \text { (purple) (colourless) } \\
& 3 \mathrm{SO}_{3}{ }^{2-}(\mathrm{aq})+\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}(\mathrm{aq})+8 \mathrm{H}+(\mathrm{aq})->3 \mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})+2 \mathrm{Cr}^{3+}(\mathrm{aq})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \\
& \text { (Orange) (green) }
\end{aligned}
$$

- Carbon(IV)oxide forms an insoluble white precipitate of calcium carbonate if three drops of lime water are added into the reaction test tube when effervescence is taking place. Sulphur(IV)oxide will not.

Chemical equation:

$$
\mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{aq})+\mathrm{CO}_{2}(\mathrm{~g})->\mathrm{CaCO}_{3}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

These tests should be done immediately after acidifying to ensure the gases produced react with the oxidizing agents/lime water.

Summary test for Sulphate (VI) $\left(\mathrm{SO}_{4} \underline{ }^{2-}\right)$ and Sulphate(IV) $\left(\mathrm{SO}_{3} \underline{ }^{2-}\right)$ salts

## Practice revision question

1. Study the flow chart below and use it to answer the questions that follow

(a)Identify the:

## I: Sodium salt solution

Sodium sulphate(IV)/Na2SO3

## II: White precipitate

Barium sulphate(IV)/BaSO3

## III: Gas G

Sulphur (IV)Oxide / $\mathrm{SO}_{2}$
IV: Colourless solution H
Barium chloride $/ \mathrm{BaCl}_{2}$
(b)Write an ionic equation for the formation of:

## I.White precipitate

Ionic equation

$$
\mathrm{Ba}^{2+}(\mathrm{aq})+\mathrm{SO}_{3}{ }^{2-}(\mathrm{aq})->\mathrm{BaSO}_{3}(\mathrm{~s})
$$

## II.Gas G

Ionic equation

$$
\mathrm{BaSO}_{3}(\mathrm{~s})+2 \mathrm{H}^{+}(\mathrm{aq})->\mathrm{SO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{Ba}^{2+}(\mathrm{aq})
$$

## III. Green solution from the orange solution

$$
\underset{\text { (Orange) }}{3 \mathrm{SO}_{3}{ }^{2-}(\mathrm{aq})}+\underset{\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}(\mathrm{aq})}{\mathrm{CO}^{2} \mathrm{H}+(\mathrm{aq})}->\mathrm{SOO}_{4}{ }^{2-(\mathrm{aq})}+\underset{\text { (green) }}{2 \mathrm{Cr}^{3+}(\mathrm{aq})}+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

2. Study the flow chart below and answer the questions that follow.

(i)Write equation for the reaction taking place at:
I.The roasting furnace
$2 \mathrm{FeS}_{2}(\mathrm{~s})+5 \mathrm{O}_{2}(\mathrm{~g}) \quad->2 \mathrm{FeO}(\mathrm{s})+4 \mathrm{SO}_{2}(\mathrm{~g})$
II.The absorption tower
$\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{l})+\mathrm{SO}_{3}(\mathrm{~g}) \quad->\mathrm{H}_{2} \mathrm{~S}_{2} \mathrm{O}_{7}(\mathrm{l})$
III.The diluter
$\mathrm{H}_{2} \mathrm{~S}_{2} \mathrm{O}_{7}(\mathrm{l})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \quad->\mathbf{2 H}_{2} \mathrm{SO}_{4}(\mathrm{l})$
(ii) The reaction taking place in chamber K is

$$
\mathrm{SO}_{2}(\mathrm{~g})+{ }^{1} / 2 \mathrm{O}_{2}(\mathrm{~g}) \mathrm{SO}
$$

I. Explain why it is necessary to use excess air in chamber K

## To ensure all the $\mathrm{SO}_{2}$ reacts

II.Name another substance used in chamber K

## Vanadium(V)oxide

3.(a)Describe a chemical test that can be used to differentiate between sodium sulphate (IV) and sodium sulphate (VI).

> Add acidified Barium nitrate(V)/chloride. White precipitate formed with sodium sulphate (VI)
> No white precipitate formed with sodium sulphate (IV)
(b)Calculate the volume of sulphur (IV) oxide formed when 120 kg of copper is reacted with excess concentrated sulphuric(VI)acid. $(\mathrm{Cu}=63.5,1$ mole of a gas at s.t.p $=22.4 \mathrm{dm} 3$ )

Chemical equation
$\mathrm{Cu}(\mathrm{s})+2 \mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{l})->\mathrm{CuSO}_{4}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})+\mathrm{SO}_{2}(\mathrm{~g})$
Mole ratio $\mathrm{Cu}\left(\mathrm{s}: \mathrm{SO}_{2}(\mathrm{~g})=1: 1\right.$

## Method 1

1 Mole $\mathrm{Cu}=63.5 \mathrm{~g} \quad->\quad 1 \mathrm{~mole}_{\mathrm{SO}}^{2} 2=22.4 \mathrm{dm} 3$
$(120 \times 1000) \mathrm{g} \quad->\quad \frac{(120 \times 1000) \mathrm{g} \times 22.4 . \mathrm{dm} 3)}{63.5 \mathrm{~g}}$

$$
=\underline{\mathbf{4 2 3 3 0 . 7 0 8 7}}
$$

Method 2
Moles of $\mathrm{Cu}=$

$$
(120 \times 1000) \mathrm{g}=\mathbf{1 8 8 9 . 7 6 3 9} \text { moles }
$$

$$
63.5
$$

Moles $\mathrm{SO}_{2}=$ Moles of $\mathrm{Cu}=\mathbf{1 8 8 9 . 7 6 3 9}$ moles
Volume of $\mathrm{SO}_{2}=$ Mole x molar gas volume $=(1889.7639$ moles $\times 22.4)$

$$
=\underline{\mathbf{4 2 3 3 0} .7114}
$$

4. Use the reaction scheme below to answer the questions that follow.

(a)Identify the:
(i)cation responsible for the green solution T
$\mathrm{Cr}^{3+}$
(ii)possible anions present in white precipitate R

$$
\mathrm{CO}_{3}^{2-}, \mathrm{SO}_{3}^{2-}, \mathrm{SO}_{4}^{2-}
$$

(b)Name gas V

## Sulphur (IV)oxide

(c)Write a possible ionic equation for the formation of white precipitate R .
$\mathrm{Ba}^{2+}(\mathrm{aq})+\mathrm{CO}_{3}{ }^{2-}(\mathrm{aq}) \quad->\mathrm{BaCO}_{3}(\mathrm{~s})$
$\mathrm{Ba}^{2+}(\mathrm{aq})+\mathrm{SO}_{3}^{2-}(\mathrm{aq}) \quad->\mathrm{BaSO}(\underset{3}{(\mathrm{~s})}$
$\mathrm{Ba}^{2+}(\mathrm{aq})+\mathrm{SO}_{4}^{2-}(\mathrm{aq}) \quad->\mathrm{BaSO}(\underset{4}{(\mathrm{~s})}$

[^0]:    Compound U
